INDIVIDUAL COMMENTS

IND15-12 (cont'd)

minimum wage) for all days worked prior to receiving such notification (not to exceed five (5) days) and for which no wages have yet been paid as required by this Agreement. If subsequent testing reveals a false positive, the Employee will be entitled to full compensation for the period he worked and reinstatement. The results of all tests will be kept confidential between the Employee, the Employer and the Union.

XIV.
TRAINING/DOT RULES

(A) Training – The Trustees of the Teamsters National Pipeline Training Fund will develop a National Pipeline Training Program for Teamsters to train in operating pipeline equipment in areas of high pipeline construction.

(B) DOT Rules – The Trustees of the Teamsters National Pipeline Training Fund will develop a DOT training program to teach Teamsters the necessary skills to comply with DOT driver requirements. Part of this program will be to develop a general pre-dispatch drug and alcohol testing program to be applied to all drivers seeking work under the National Pipe Line Agreement.

(C) Contributions shall be made to the Teamsters National Pipe Line Training Fund and Labor-Management Cooperation Trust in accordance with Schedule "A" and the provisions above. The National Pipe Line Training Fund will establish proficiency training standards to be used in a National Pipeline Training Course, which will include specific Operator Qualification training. Regional training courses also will be set up throughout the country as necessary and will be subject to the proficiency training standards developed by the Fund. A list of Teamsters who have successfully completed the course will be made available to signatory contractors on request. Funds contributed to local training funds for pipeline work covered under the National Pipe Line Agreement should be used by the local funds to provide pipeline and OQ training. Local pipeline training will be monitored by the Teamsters National Pipe Line Training Fund.

XV.
HISTORICAL PRECEDENT

Since the inception of the National Pipe Line Agreements, which cover all main line, cross-country pipeline construction, only four (4) Unions have been recognized, and all work relating to such pipeline construction has been performed by these four (4) Unions. They are: The International Brotherhood of Teamsters, The United Association of Journeyman and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada, The International Union of Operating Engineers, and the Laborers' International Union of North America. The recognition of only these four (4) Unions on such work is hereby reaffirmed.

XVI.
INDIAN PREFERENCE IN EMPLOYMENT

The hiring procedures contained in this Agreement shall not apply in the "territorial jurisdiction" of any Indian Nation which has adopted an Indian Preference in Employment law, provided that those persons covered by the law and seeking covered employment under this

Objective...

- Dallas Fort Worth market recruitment Job Fair on Friday August 17th, Saturday August 18th and Sunday August 19th. THE GOAL: driving attendance and traffic to Teamsters Union Hall Local 745 to fill jobs ASAP on Gulf Coast Pipeline.
- Target reach: Men 21 – 64 years (must have CDL)
- Featuring a 9 day high frequency media blitz starting Saturday 8/11/18 – Sunday 8/19/18 cut off at 10am.
- Focusing on media platforms that have brought Teamsters success - Radio, TV, and Streaming TV
- Targeted market: Dallas Fort Worth, TX areas

Our "Go to Market" Recommendation...

- Knowing the amount of hires that need to be made, we are recommending at least a 9 day campaign focusing on a dominate presence in the Dallas market using:
  - Radio
  - Local Television
  - Streaming Television – Premion, Facebook, YouTube
- As added value with no additional cost to the Teamsters (Katie Muniak) will write and distribute press release to all local newspapers and media outlets about Atlantic Coast Pipeline project and jobs.
- With radio, we will include again :15 second PSA radio commercials on the stations involved.

Port Arthur LNG

CHENIERE

November 30, 2018

Hon. Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street, N.E.
Washington, D.C. 20426

Re: Port Arthur LNG, LLC; PALNG Common Facilities Co., LLC; Port Arthur Pipeline, LLC
Docket Nos. CP17-20-000, CP17-21-000, CP17-21-001 and CP18-7-000
Joint Statement on Cooperation

Dear Ms. Bose:

IND16-1 (cont'd)

On November 19, 2018, Sabine Pass LNG, L.P., Sabine Pass Liquefaction, LLC and Cheniere Creole Trail Pipeline, L.P. (collectively, Sabine Pass and Creole Trail) submitted comments (November 19 Comments) regarding certain limited aspects of the Port Arthur Liquefaction, Texas Connector and Louisiana Connector Projects (the Project). These comments noted that Sabine Pass and Creole Trail are not opposed to the Project, but are working in coordination with Port Arthur LNG, LLC, Port Arthur Common Facilities Co. LLC and Port Arthur Pipeline, LLC (Port Arthur) representatives to resolve potential concerns associated with construction and operation of jurisdictional facilities in close proximity. For its part, although Port Arthur does not agree with the points and requests made in the November 19 Comments, it is committed to working cooperatively to address the comments of Sabine Pass and Creole Trail.

This joint letter provides the Commission with updates on the progress the parties are making to address these matters. Our project teams are scheduled to meet in person during the first week of December. Initial discussions have been cordial, and we are optimistic that further refinement of the issues and a mutual resolution can be reached before Commission issuance of the Final Environmental Impact Statement for the Project. For this reason, the undersigned parties request that the Commission Staff withhold action on the Sabine Pass and Creole Trail requested condition and cumulative impacts analysis pending the outcome of these discussions among the parties.

The parties anticipate filing a status update following the December meeting.

Sincerely,

/s/ Jerrod L. Harrison

REGULATORY COMMISSION

ORIGINAL

November 15, 2018

Kimberly D. Bose, Secretary
Federal Energy Regulatory Commission
888 First Street NE, Room 1A
Washington, D.C. 20426

Dear Ms. Bose: CP17-20-000

The U.S. Environmental Protection Agency (EPA) has reviewed the Draft Environmental Impact Statement (DEIS) for the Port Arthur LNG and Connector Projects (CEQ No. 20180229) pursuant to the National Environmental Policy Act (NEPA), the Council on Environmental Quality regulations (40 CFR Parts 1500 – 1508), and our NEPA review authority under Section 309 of the Clean Air Act.

The purpose of the proposed action is to construct and operate onshore natural gas liquefaction and associated facilities in Texas to allow the export of liquefied natural gas, and to construct, own, operate, and maintain interstate natural gas pipelines, new compressor stations, and ancillary facilities in Texas and Louisiana. The EPA is a cooperating agency for this project.

FA1-1 EPA's primary concerns are the potential impacts to wetlands. Section 4.4 of the DEIS discusses temporary wetland impacts associated with construction and operation of the proposed action. For scrub-shrub wetlands, the DEIS identifies a timeline of 2 to 4 years to reach functionality similar to preconstruction conditions, and even longer for forested wetlands. Lastly, there are forested wetlands that may be converted into other wetland types. If available at the time the Final Environmental Impact Statement (FEIS) is published, please include the following: compensatory mitigation for each of the impacted wetlands, location of compensatory mitigation sites and demonstration of in-kind or appropriate out-of-kind compensatory mitigation options, the amount of dredge material produced in each area and the projected beneficial use project(s), including location of the dredge placement sites and the resulting acreage produced by the project.

FA1-2 Section 4.9.8.3 identifies the primary project-related health risk associated with an unanticipated failure at the liquefaction terminal, pipelines, or compressor stations. The EPA suggests the FEIS incorporates a map of the population demographics in proximity to the proposed action to further characterize those at potential risk.

Please note that effective October 22, 2018, the EPA no longer includes ratings in our comment letters. Information about this change is explained in the Memorandum on Changes to EPA's Environmental Review Rating Process, available at https://www.epa.gov/nepa/policy-and-procedures-review-federal-actions-impacting-environment-under-section-309-clean-air.

FA1-1 See response to comment SA3-1 regarding compensatory mitigation.

Sections 2.1.1.5, 2.1.1.6, and 2.1.1.7 of the final EIS discuss the locations and amounts of dredge materials removed. Sections 2.1.1.10 and 4.4.2.1 describe the disposal areas and beneficial reuse of dredge materials.

FA1-2 If there were to be a failure of the pipelines or LNG facilities, it would be at a specific point along the pipeline or within the facilities. Consequences from such failures are required to be evaluated under DOT regulations in 49 CFR 192 for pipelines and 49 CFR 193 for the LNG facilities, and require certain provisions be in place based on the consequences. In addition, consequences from accidental and intentional failures of the LNG marine vessels are required to be evaluated under U.S. Coast Guard regulations and are discussed in Section 4.12.

The DOT regulations do not allow for certain credible consequences to extend beyond a property line that can be built upon. In addition, FERC staff evaluates a variety of consequences to ensure the risk of other higher consequences are reduced to insignificant levels. The U.S. Coast Guard also evaluates the consequences from LNG marine vessels to ensure the risk to the public is reduced to an insignificant level.

Section 4.9.8 discusses environmental justice and concludes that no there is no evidence that the Projects would cause a disproportionate share of adverse environmental or socioeconomic impacts on any racial, ethnic, or socioeconomic group. This conclusion takes into account the demographics associated with the census tracts impacted by the Projects. We defer to our analysis in section 4.9.8 of the demographics, and more broadly in section 4.9. Section 4.12 also discusses the safety of the facilities and the regulatory oversight.

Subject: LNU-Farmland Protection
Port Arthur Liquefaction Project
Docket No. (CP17-20-000, CP17-21-000, CP18-7-000)
NEPA/FPPA Evaluation
Jefferson and Orange Counties, Texas

SA1-1

We have reviewed the information provided in your correspondence dated September 28, 2018 concerning the proposed natural gas pipeline improvements project located in Jefferson and Orange Counties, Texas. This review is part of the National Environmental Policy Act (NEPA) evaluation for the Federal Energy Regulatory Commission (FERC). We have evaluated the proposed site as required by the Farmland Protection Policy Act (FPPA).

The proposed North Compressor Station site contains areas of Statewide Important Farmland and we have completed the Farmland Conversion Impact Rating form (AD-1006) for the proposed site. The combined rating of the site is **88**. The proposed South Compressor Station site does not involve areas of Prime Farmland. The FPPA law states that sites with a rating less than 160 will need no further consideration for protection and no additional evaluation is necessary.

Additionally, the installation of belowground pipelines and appurtenances are not considered a permanent conversion of farmland. Therefore, the corresponding activities of the project are exempt from provisions of FPPA. We urge you to use accepted erosion control methods during construction and to place topsoil back as the surface layer when backfilling trenches.

If you have further questions, please contact me at 254.742.9836 or by email at Carlos.Villarreal@usda.gov (Preferred).

Sincerely,

CARLOS VILLARREAL

STATE AGENCY COMMENTS

20181113-0011 FERC PDF (Unofficial) 11/13/2018

STEPS IN THE PROCESSING THE FARMLAND AND CONVERSION IMPACT RATING FORM

Step 1 - Federal agencies (or Federally funded projects) involved in proposed projects that may convert farmland, as defined in the Farmland Protection Policy Act (FPPA) to nonagricultural uses, will initially complete Parts I and III of the form. For Corridor type projects, the Federal agency shall use form NRCS-CPA-106 in place of form AD-1006. The Land Evaluation and Site Assessment (LESA) process may also be accessed by visiting the FPPA website, http://fppa.nrcs.usda.gov/lesa/.

Step 2 - Originator (Federal Agency) will send one original copy of the form together with appropriate scaled maps indicating location(s)of project site(s), to the Natural Resources Conservation Service (NRCS) local Field Office or USDA Service Center and retain a copy for their files. (NRCS has offices in most counties in the U.S. The USDA Office Information Locator may be found at http://offices.usda.gov/scripts/ndISAPI.dll/oip_public/USA_map, or the offices can usually be found in the Phone Book under U.S. Government, Department of Agriculture. A list of field offices is available from the NRCS State Conservationist and State Office in each State.)

Step 3 - NRCS will, within 10 working days after receipt of the completed form, make a determination as to whether the site(s) of the proposed project contains prime, unique, statewide or local important farmland. (When a site visit or land evaluation system design is needed, NRCS will respond within 30 working days.

Step 4 - For sites where farmland covered by the FPPA will be converted by the proposed project, NRCS will complete Parts II, IV and V of the form.

Step 5 - NRCS will return the original copy of the form to the Federal agency involved in the project, and retain a file copy for NRCS records.

Step 6 - The Federal agency involved in the proposed project will complete Parts VI and VII of the form and return the form with the final selected site to the servicing NRCS office.

Step 7 - The Federal agency providing financial or technical assistance to the proposed project will make a determination as to whether the proposed conversion is consistent with the FPPA.

INSTRUCTIONS FOR COMPLETING THE FARMLAND CONVERSION IMPACT RATING FORM
(For Federal Agency)

Part I: When completing the "County and State" questions, list all the local governments that are responsible for local land use controls where site(s) are to be evaluated.

Part III: When completing item B (Total Acres To Be Converted Indirectly), include the following:

1. Acres not being directly converted but that would no longer be capable of being farmed after the conversion, because the conversion would restrict access to them or other major change in the ability to use the land for agriculture.
2. Acres planned to receive services from an infrastructure project as indicated in the project justification (e.g. highways, utilities planned build out capacity) that will cause a direct conversion.

Part VI: Do not complete Part VI using the standard format if a State or Local site assessment is used. With local and NRCS assistance, use the local Land Evaluation and Site Assessment (LESA).

1. Assign the maximum points for each site assessment criterion as shown in § 658.5(b) of CFR. In cases of corridor-type project such as transportation, power line and flood control, criteria #5 and #6 will not apply and will, be weighted zero, however, criterion #8 will be weighed a maximum of 25 points and criterion #11 a maximum of 25 points.

2. Federal agencies may assign relative weights among the 12 site assessment criteria other than those shown on the FPPA rule after submitting individual agency FPPA policy for review and comment to NRCS. In all cases where other weights are assigned, relative adjustments must be made to maintain the maximum total points at 160. For project sites where the total points equal or exceed 160, consider alternative actions, as appropriate, that could reduce adverse impacts (e.g. Alternative Sites, Modifications or Mitigation).

Part VII: In computing the "Total Site Assessment Points" where a State or local site assessment is used and the total maximum number of points is other than 160, convert the site assessment points to a base of 160.
Example: if the Site Assessment maximum is 200 points, and the alternative Site "A" is rated 180 points:

$$\frac{\text{Total points assigned Site A}}{\text{Maximum points possible}} = \frac{180}{200} \text{ X } 160 = 144 \text{ points for Site A}$$

For assistance in completing this form or FPPA process, contact the local NRCS Field Office or USDA Service Center.

NRCS employees, consult the FPPA Manual and/or policy for additional instructions to complete the AD-1006 form.

Re: *Draft Environmental Impact Statement for the Proposed Port Arthur Liquefaction Project, Texas Connector Project, and Louisiana Connector Project (CP17-20-000, CP17-21-000, and CP18-7-000), Jefferson and Orange Counties (FERC/106, THC #201900840)*

Dear Kimberly D. Bose:

Thank you for your correspondence describing the above referenced project. This letter serves as comment on the proposed undertaking from Mark Wolfe, Executive Director of the Texas Historical Commission and the State Historic Preservation Officer.

The History Programs Division (HPD) review staff, led by Caitlin Brashear, the Division of Architecture (DOA) review staff, led by Lydia Woods, and the Archeology Division (AD) review staff, led by Maggie Moore and Amy Borgens, have completed their review of the draft environmental impact statement (DEIS) for the proposed Port Arthur Liquefaction Project, Texas Connector Project, and Louisiana Connector Project (CP17-20-000, CP17-21-000, and CP18-7-000. Regarding this review, the THC has the following comments.

SA2-1 Beginning on page 4-211, the DEIS summarizes the archeological investigations that have been conducted to date and the associated review responses from the THC. On page 4-212, the DEIS states that "in a letter dated September 16, 2016, the Texas SHPO concurred with the Phase I Cultural Resources Survey Report's NRHP assessment of not eligible for the identified five historic architecture resources." The THC did not provide concurrence for those five structures in that response letter, however the THC does concur that those five structures are **not eligible** for listing to the National Register of Historic Places (NRHP).

SA2-2 The Texas portion of the Port Arthur Pipeline Project in Sabine Lake was surveyed by T. Baker Smith and R. Christopher Goodwin and Associates, Inc. in August 2017. Comments from the THC were omitted from the DEIS in Section 4.10.1.2 page 4-213, regarding the submerged archeological investigation of the pipeline that extends into Texas waters except to state that the SHPO comments have not been provided—the meaning of which is unclear.

SA2-3 The THC reviewed the draft report for the underwater remote-sensing archeological survey conducted by Goodwin and Associates for Antiquities Permit No. 8060. Additional information was required for magnetometer targets 21, 37, 57, and 59 before the review could be completed. The THC cannot concur "that no submerged cultural resources nor relic geomorphic features with the potential for archaeological deposits were present" until additional information is provided, An inquiry was sent to the archeological contractor on 29 December 2017, 9 February 2018, and again on 22 October 2018 after the DEIS was received.

SA2-4 Our July 28, 2017 letter requesting scraping at Granger Cemetery was in response to an email indicating the line would in fact be placed within 25 feet of the cemetery. Additionally, to date our office has not received reports on the cemetery scraping; survey of the three previously recorded sites 41JF84, 41JF91, and 41OR89; or on the remaining Northern pipeline, laterals, TETCO and NGPL Meter Stations, and access roads. This work is not mentioned in outstanding Section 106 obligations listed in Section 4.10.4.2. Please include the completion of this work prior to construction of facilities or use of staging, storage, or temporary workspaces to Section 4.10.4.2. According to our records, the THC has not received or reviewed an anticipated discovery plan as stated in Section

SA2-1 Section 4.10.1.2 of the final EIS has been updated to reflect the correct date of concurrence for the five historic architecture resources.

SA2-2 To date, PAPL has not provided this information to the FERC.

SA2-3 To date, PAPL has not provided this information to the FERC.

SA2-4 To date, PAPL has not provided this information regarding the Granger Cemetery to the FERC.

Based on information from the Applicants, and as stated in section 4.10.2 of the final EIS, PALNG and PAPL committed to providing its *Unanticipated Discoveries Plans* to the Texas SHPO for review. If additional changes to the *Unanticipated Discoveries Plan* are required, FERC requests that these be directed to PALNG and PAPL. Per Environmental Recommendations 4 and 5, PALNG and PAPL will be required to file all pending agency correspondence and all final survey reports. The *Unanticipated Discoveries Plan* provided to FERC can be found on the FERC eLibrary website using Accession Numbers 20161129-5254 (Liquefaction Project) and 20171212-5147 (Texas Connector Project). Also, PAPL filed a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005). .

STATE AGENCY COMMENTS

20181119-0024 FERC PDF (Unofficial) 11/19/2018

SA2-4 (cont'd) 4.10.2. The THC recommends that an anticipated discovery plan needs to be submitted for review and concurs that any portion of the project that has not yet been surveyed needs to be surveyed and submitted for review by our office.

SA2-5 Finally, it should be noted that a portion of the proposed Texas Connector Project will be located within the *Lucas Gusher, Spindletop Oil Field* (NR# 66000818), which was listed in the National Register as a historic district in 1966. Therefore, a clearer idea of impact on the historic district is needed. In addition, in accordance with Section 110, the National Park Service needs to be involved with this review since the historic district is also a National Historic Landmark.

We look forward to further consultation with your office and hope to maintain a partnership that will foster effective historic preservation. Thank you for your cooperation in this federal review process, and for your efforts to preserve the irreplaceable heritage of Texas. If you have any questions concerning our review or if we can be of further assistance, for archeology please contact Maggie Moore at 512-463-6508 or maggie.moore@thc.texas.gov, for marine archeology please contact Amy Borgens at 512-463-9505 or amy.borgens@thc.texas.gov, for architecture please contact Lydia Woods at 512-463-9122 or lydia.woods@thc.texas.gov, or contact Caitlin Brashear at 512-463-5851 or caitlin.brashear@thc.texas.gov.

Sincerely,

Caitlin Brashear

Re: Port Arthur LNG, LLC; PALNG Common Facilities Company, LLC; Port Arthur Pipeline, LLC
Notice of Availability of the Draft Environmental Impact Statement for the Proposed Port Arthur Liquefaction Project, Texas Connector Project, and Louisiana Connector Project
Docket Nos. CP17-20-000
CP17-21-000
CP17-21-001
CP18-7-000

Dear Secretary Bose:

Texas Parks and Wildlife Department (TPWD) has reviewed the subject Draft Environmental Impact Statement (DEIS), dated September, 2018. The overall purpose of the three subject projects is to convert natural gas into liquefied natural gas (LNG) for export. The Liquefaction Project (LP), located in Jefferson County, Texas, would consist of a liquefaction facility that includes two liquefaction trains, a two-berth marine terminal for ship docking and loading, and various other infrastructure components. In addition, the LP would relocate 3.3 miles of State Highway 87 and existing pipelines and utilities that parallel the highway. Natural gas would be supplied to the LP by two, 42-inch-diameter pipelines. The Texas Connector Project (TCP) would include about 34.2 miles of pipeline with associated infrastructure and would be located in Jefferson and Orange Counties, Texas and Cameron Parish, Louisiana. The Louisiana Connector Project (LCP) would include about 130.8 miles of pipeline with associated infrastructure and would be located in Jefferson County, Texas and multiple parishes in Louisiana.

TPWD's comments below on fish and wildlife resources relate only to the Texas portions of the proposed projects.

Compensatory Mitigation for Wetland Impacts

SA3-1 Construction of the projects would impact a total of about 2,105 acres of wetlands in Texas based on data from pages ES-5, ES-6, 4-54 and 4-55. As compensation for the LP's wetland impacts, the applicant proposes placing 2.4 million cubic yards of dredged material into TPWD's J.D. Murphree Wildlife Management Area (WMA) to restore about 1,269 acres of tidally influenced coastal marsh. However, no compensation was proposed for any of the TCP's proposed wetland impacts.

Commissioners
Ralph H. Duggins, Chairman, Fort Worth
S. Reed Morian, Vice-Chairman, Houston
T. Dan Friedkin, Houston
Anna B. Galo, Laredo
Bill Jones, Austin
Jeanne W. Latimer, San Antonio
James H. Lee, Houston
Dick Scott, Wimberley

Lee M. Bass, Chairman-Emeritus, Fort Worth

Carter P. Smith, Executive Director

4200 SMITH SCHOOL ROAD
AUSTIN, TEXAS 78744-3291
512.389.4800
www.tpwd.texas.gov

To manage and conserve the natural and cultural resources of Texas and to provide hunting, fishing and outdoor recreation opportunities for the use and enjoyment of present and future generations.

SA3-1 PAPL has submitted an application to the USACE for compensatory mitigation using wetland mitigation bank credits and agency in-lieu fee programs for the Texas Connector Project, as discussed in section 4.4.2.2 of the final EIS. An USACE-approved Compensatory Mitigation Plan is tied to the USACE's overall consideration of whether to issue section 404 Permits for dredging activities and wetland impacts associated with construction of the Projects, including the Texas Connector Project. The USACE would ultimately determine if the Applicants' proposed mitigation is adequate and that it would compensate for any remaining impacts that can neither be avoided nor minimized such that overall project impacts on the aquatic environment are minimal on both an individual and cumulative basis. Per Environmental Recommendation 10 in section 5.2, PAPL would be required to receive written authorization from the Director of OEP before commencing construction of any project facilities and, to obtain such authorization, PAPL must file documentation that it has received all applicable authorizations required under federal law (or evidence of waiver thereof), which includes those required by the USACE.

STATE AGENCY COMMENTS

20181119-5084 FERC PDF (Unofficial) 11/19/2018 10:55:56 AM

SA3-1 (cont'd)

Recommendations: The applicant should compensate for all temporary and permanent wetland impacts identified for the TCP as follows:

- Purchase the appropriate amount of in-kind wetland credits from the Pineywoods Mitigation Bank for impacts to forested wetlands and for impacts to freshwater, non-forested wetland impacts occurring within the bank's secondary service area. Specifically, this includes project features associated with the northern pipeline (i.e., milepost 20.1 to 26.55 of the mainline, lateral pipelines, access roads, additional temporary workspaces, contractor yard 3, and the north compressor station).

- Increase the amount of compensation proposed at the WMA by incorporating estuarine wetland impacts.

SA3-2

Compensatory mitigation conducted on TPWD-owned lands must be done in a manner consistent with the mission of TPWD, department policy, and applicable Texas laws (e.g., Chapter 26 of the Parks and Wildlife Code and Chapter 34 of the Natural Resources Code). Specific details of any habitat restoration activity will need to be reviewed on a case-by-case basis, and each project will need to be compatible with the mission, and short-term and long-term restoration needs and goals of TPWD at the time the project is undertaken.

Page 4-20 addresses coordination between TPWD and the applicant regarding placement of dredged material at the WMA for compensatory mitigation. However, page 4-162 states, "PALNG has entered into a lease agreement . . . with the TPWD." Although we have agreed in principle that we will accept dredged material on the WMA, and we have granted the applicant written permission to access the WMA for their planning and data gathering efforts, TPWD does not have any written lease or other agreement with the applicant to conduct compensatory mitigation at this time.

Recommendation: Section 4.8.4.1 be revised to read as follows: "PALNG is negotiating a surface use agreement with the TPWD to use the J.D. Murphree WMA as a site for placement of dredge material."

TPWD does not grant a surface use agreement for third-party habitat restoration projects on the WMA until the work is imminent, TPWD has documentation that the dredge material is clean and usable, a complete mitigation plan is in hand and approved, and a specific location(s) has been determined based on local needs at the time. In addition, TPWD does not grant exclusive access to any one entity for habitat restoration at the WMA and will continue to pursue restoration partnerships with other public and private entities. Therefore, any area(s) within the WMA may, at TPWD discretion, be restored at any time if need and availability of dredge material coincide. This may make areas within the WMA identified in the proposed compensatory mitigation plan unavailable to the applicant.

Recommendation: The applicant should continue coordination with TPWD for use of the WMA as a component of their compensatory mitigation plan.

SA3-2 PALNG has stated it would continue to work with the TPWD to develop a beneficial use of dredge material plan as part of a Surface Use Agreement for placement of material at the J.D. Murphree WMA, as discussed in section 4.2.2.1 of the final EIS.

Section 4.8.4.1 of the final EIS has been revised to reflect the recommended language.

STATE AGENCY COMMENTS

20181119-5084 FERC PDF (Unofficial) 11/19/2018 10:55:56 AM

Oyster Impacts

SA3-3 No explicit statement was provided anywhere within the DEIS on whether oyster habitat would be avoided or impacted. However, TPWD is concerned that proposed construction activities associated with the installation of the LCP pipeline could bury or smother a total of about 2.44 acres of oyster habitat within the Texas portion of Sabine Lake (based on analysis of GIS shape files associated with the applicant's oyster survey assessment dated October, 2017). Specifically, three oyster habitat areas, consisting of 0.502-acre, 0.442-acre, and 0.419-acre patch reefs, were identified in the 300-foot-wide temporary construction workspace[1] east of the horizontal directional drill (HDD) exit at milepost 0.8.

Recommendation: The HDD exit should be relocated about 768 feet toward the northeast (Latitude 30.029614° North, Longitude 95.286616° West) to avoid direct impacts to these three oyster habitat areas.

There are also two oyster habitat areas, 0.783 acre and 0.297 acre, located within the pullback area identified as ATWS-JEF-006.

Recommendation: Direct impacts to these two oyster habitat areas may be avoided by marking these areas during construction as vessel exclusion zones so that pipelines and other equipment are not placed on or dragged over oyster habitat.

SA3-4 TPWD is also concerned that vessel access, travel lanes, and associated activities (e.g., vessels carrying equipment on deck to workspaces or dragging pipes along the lake bottom) could potentially impact oyster habitat outside of the proposed temporary workspaces.

Recommendation: The applicant should develop a vessel access route and plan, and coordinate the proposed plan with the resource agencies, particularly TPWD, so that an appropriate route(s) can be identified that will avoid oyster habitats. TPWD also recommends the proposed plan include the following information:

- A map that identifies the travel lanes for each route in relation to the proposed temporary workspaces, the 50-foot-wide permanent right-of-way, and the pipeline's centerline. The map should also contain geographic coordinates (in decimal degrees) for each travel lane to include the vessel entry point, vessel exit point, and each angle (or bend).
- The designated access route(s) will be marked with reflective PVC pipe, or other suitable material and with numeric labeling, to assure that vessel operators can easily follow the access route.

[1] The 300-foot-wide temporary construction workspace includes the 50-foot-wide permanent right-of-way.

SA3-3 Section 4.6.2.1 of the final EIS has been updated based on PAPL's supplemental filing. PAPL has proposed mitigation measures for potential impacts on oyster resources, including providing compensation to the TPWD towards an oyster restoration project in the watershed, providing suitable material for an oyster cultch plant within the lake to offset impacts, or reseeding the temporary workspace after construction with live oysters or cultch material. If PAPL would modify its proposed HDD location as a result of consultations with the TPWD and to avoid oyster beds, it would be required to file a revised HDD crossing plan for FERC review and approval prior to construction.

SA3-4 See response to comment SA3-3.

STATE AGENCY COMMENTS

20181119-5084 FERC PDF (Unofficial) 11/19/2018 10:55:56 AM

SA3-4 (cont'd)

- All channel markers will be inspected daily, and all missing markers will be replaced within 12 hours.
- Establish a minimum 2.0-foot clearance between the lake bottom and the vessel bottom for all vessel entries and exits.
- Vessel drafts should not exceed the minimum water depths within the project area and access route(s).
- Tide staffs should be placed at key points along the access route(s) for vessel operator reference and record keeping.
- Vessel operators should be required to log the draft of the vessel and the tide level prior to vessel movements.
- Any oyster habitat identified within the proposed pullback area, HDD exit location, and access route(s) should be protected with boom-type silt curtains.
- The applicant should submit pre-project and post-project bottom elevation surveys along the pipeline and access route(s) to verify that no prop/wheel-washing occurred as a result of the project. Transects should be spaced a maximum of 50 feet apart and continual soundings will be taken along those transects. The applicant should take soundings along transects located on the clearly marked access route right-of-way along the centerline and 200 feet on each side of the centerline. All survey results should be submitted to the U.S. Army Corps of Engineers – Galveston District. A GPS plot of the route should be submitted with the survey results.

Essential Fish Habitat-Managed Species

SA3-5 Page 4-110 states that Bull Shark *Carcharhinus leucas* juveniles, neonates, and adults are rare within the Sabine-Neches Waterway. However, this statement is inconsistent with TPWD gillnet sampling data for shark abundances in the Sabine Lake system. Bull Sharks are often present and, in fact, are the most abundant shark species found in the Sabine Lake system.

Recommendation: The term "rare" should be replaced with "often present".

Threatened and Endangered Species

SA3-6 On October 9, 2018, the Eastern Black Rail *Laterallus jamaicensis* was proposed to be listed by the U.S. Fish and Wildlife Service (USFWS) as threatened under the federal Endangered Species Act.

Recommendation: If impacts to Eastern Black Rail are anticipated, then TPWD recommends coordination with USFWS' Texas Coastal Ecological Services Field

SA3-5 Section 4.6.3.1 of the final EIS has been revised to reflect the recommended language.

SA3-6 Section 4.7.3.5 has been added to the final EIS to address the Eastern black rail.

STATE AGENCY COMMENTS

20181119-5084 FERC PDF (Unofficial) 11/19/2018 10:55:56 AM

SA3-6 (cont'd) Office – Houston (281-286-8282), and with TPWD as appropriate, to determine avoidance or other appropriate mitigation strategies.

Texas Natural Diversity Database

SA3-7 TPWD maintains records of occurrence for legally protected and other Species of Greatest Conservation Need within the Texas Natural Diversity Database (TXNDD), and these data are publicly available by request. The TXNDD is intended to assist users in avoiding harm to rare species. The TXNDD is updated continuously and relies partially on information submitted by private parties, such as developers or their consultants. Given the small proportion of public versus private land in Texas, the TXNDD does not include a representative inventory of rare resources in the state.

Recommendation: To aid in the scientific knowledge of a species' status and current range, TPWD encourages reporting encounters of protected and rare species to the TXNDD according to the data submittal instructions located at https://tpwd.texas.gov/huntwild/wild/wildlife_diversity/txndd/submit.phtml.

TPWD advises implementation of our previous recommendations (correspondence dated May 9, 2016 and May 8, 2017) to minimize impacts on fish and wildlife resources that are not otherwise described above.

TPWD requests that all of the above recommendations be incorporated into the Final Environmental Impact Statement. Questions can be directed to Mr. Mike Morgan (281-534-0146) in the Dickinson Marine Lab.

Sincerely,

Rebecca Hensley

Rebecca Hensley
Regional Director, Ecosystem Resources Program
Coastal Fisheries Division

RH:CR:MNM

SA3-7 FERC reviewed the Texas Natural Diversity Database when evaluating the Projects; known occurrences are reported in section 4.6.1.3 of the final EIS.

We encourage the applicant to report any encounters of rare or protected species to the Texas Natural Diversity Database.

Comments on:

Port Arthur Liquefaction Project
Projects docket number CP17-20-000, CP17-21-000 and CP18-7-000

The Sabine Pass Port Authority (SPPA) supports the Port Arthur LNG project. There are several key factors concerning the Port Arthur LNG project that make the project significant to SPPA and the community of Sabine Pass.

LA1-1 First, Sempra's commitment to relocate a section of HWY 87 away from the Sabine Neches ship channel is a significant step in providing a safer route of travel for Sabine Pass residents, visiting tourists and commercial business commuters. This highway is the only route into and out of Sabine Pass and with Sempra's pledge to move the highway to higher ground and improve the roadway it will provide many years of safe, reliable travel.

LA1-2 Second, the economic development benefits of this project will be tremendous, not just during the construction phase but also during the life of the plant's operations. The construction jobs will bring a surge of workers into the area that will buy goods and services from our businesses. It is also anticipated that many of the construction workers will take up residence in our area taking advantage of the many RV camp grounds that Sabine Pass has to offer.

LA1-1 Sections 2.1.4.1, 4.2.1.4, 4.3.2.1, 4.9.6.3, and 4.12.12 of the final EIS have been updated to indicate the possible benefits of the relocation of SH 87 as noted by commenters.

LA1-2 Comments noted. Socioeconomic effects, including tax revenue, job creation, and economic development, are discussed in section 4.9 of the final EIS.

LOCAL AGENCY COMMENTS

20181023-0026 FERC PDF (Unofficial) 10/22/2018

LA1-2 (cont'd) Over the life of the Port Arthur LNG plant, the tax revenue from the plant will enable SPPA to continue to grow which will result in the creation of new jobs and greater opportunities for the residents of Sabine Pass.

Thirdly, Sempra has already proven themselves to be a trusted business partner and community advocate. They are very active in our community and continually provide updates on the project and seek the public's insight into issues that may be of a concern. They have supported our Chamber, Schools and Civic organizations and recently took a leadership role in supporting the Coastal Conservation and Texas Parks Wildlife artificial reef project in the Sabine Pass area.

We look forward to the Port Arthur LNG project being developed in the Sabine Pass area and are confident that Sempra will continue to demonstrate the ethical, professional and community commitment that they are known for.

Sincerely,

Mic Cowart

Greater PORT ARTHUR CHAMBER OF COMMERCE

FILED
SEC... OFFICE
2018 OCT 22 P 3:22
RECD ...

October 11, 2018

Secretary Kimberly D. Bose
Federal Energy Regulatory Commission
888 First St. NE, Room 1A
Washington, DC 20426

Port Arthur Liquefaction Project
Projects docket numbers (CP17-20-000, CP17-21-000, and CP18-7-000)

The board of directors of The Greater Port Arthur Chamber of Commerce wish to enter the following comments, in support of, Port Arthur LNG Project. The Greater Port Arthur Chamber of Commerce has supported the economic development of Port Arthur for 118 years, beginning in 1899.

LA2-1 From an economic development perspective, the, multi-billion-dollar, Port Arthur LNG Project will bring new jobs and taxes, directly, to the city, school, county, state and country. The 3500 construction jobs and 200 permanent jobs will support existing local retail and service business such as, restaurants, hotels, etc. and attract new local retail and service businesses.

LA2-2 Due to having to move a 3-mile portion of Highway 87 between the Intracoastal Waterway and Keith Lake Pass, will replace a worn and outdated highway. The new highway will reduce the risk of high tides blocking this important route and benefit Sabine Pass residents and industry located between Sabine Pass and Port Arthur.

LA2-1 (cont'd) Port Arthur LNG is already investing in our community organizations such as, chambers of commerce, school foundations and other non-profit organizations. They contribute directly to Port Arthur ISD, Sabine Pass ISD and Lamar State College – Port Arthur.

LA2-3 While the chamber is a pro-business, economic development corporation it recognizes the need for environmental awareness of our industries. Port Arthur LNG's project will result in the improvement of almost 1,200 acres of degraded marshland. The project will provide for the export of a clean burning fuel to countries that are reliant on oil and coal. This is a positive benefit for our region, country and the world. Sempra LNG & Midstream is partnering with Coastal Conservation Association and the Texas Parks & Wildlife Department to support the Sabine Artificial Reef Project to build a vital habitat for a variety of species along the upper Texas Coast.

LA2-4 The Port Arthur LNG project will help promote the deepening of the channel which will benefit all user of the waterway. All new ships will bring more business, new jobs, growth of revenues to local businesses. The Port of Sabine Pass and Port of Port Arthur will receive new revenue generated from the project and channel improvement as a result there of.

Sincerely,

William B. McCoy

President/CEO

LA2-1 See response to comment LA1-2.

LA2-2 See response to comment LA1-1.

LA2-3 Comments noted. The beneficial use of dredge material to restore marshland at the J.D. Murphree WMA is discussed in sections 2.1.1.10, 4.5.2.1, 4.6.1.1, 4.6.3.2, and 4.8.6.1 of the final EIS.

LA2-4 PALNG would not be deepening the channel but instead creating additional waterway to accommodate its proposed marine berth, MOF, and Pioneer Dock. FERC notes that deepening of the Port Arthur Canal is periodically conducted under the regulatory authority of the USACE.

RE: Docket No.'s: CP17-20-000, CP17-21-000, CP18-7-000, Port Arthur Liquefaction Project, Texas Connector Project, and Louisiana Connector Project

Ms. Bose,

NAT1-1 The Choctaw Nation of Oklahoma thanks FERC for the correspondence regarding the above referenced project. This project lies in the Choctaw Nation's area of historic interest. Based upon the number of Parishes in Louisiana, there is a chance of encountering Choctaw cultural or sacred sites. Before the Choctaw Nation of Oklahoma can provide comments we will need additional information.

The Choctaw Nation Historic Preservation Department requests a copy of the EIS, a copy of the cultural resources survey, and the GIS shapefiles for the project.

If you have any questions, please contact me.

Sincerely,

Lindsey D. Bilyeu

re: Comments on Draft EIS in Docket Nos. CP17-20-000, CP17-21-000, CP17-21-001, and CP18-7-000

Dear Secretary Bose:

On behalf of the Coushatta Tribe of Louisiana, a federally-recognized Indian tribe ("CTOL"), I submit the following comments on the draft EIS issued in connection with the above-referenced dockets.

As the federal government has acknowledged in the past, the Coushatta Tribe of Louisiana has a documented and long-standing cultural, religious, and historical nexus to the lands on which the applicant in docket CP18-7-000 ("PAPL") proposes to construct the Louisiana Connector Project. The people of the Coushatta Tribe of Louisiana spent centuries settling various locations along the proposed pipeline corridor. They lived, hunted, worked, worshipped and buried their dead along this route. There is thus a significant likelihood that Tribal cultural resources, including Tribal artifacts, sites, and locations, are dispersed along the entire proposed pipeline corridor.

NAT2-1 Given the proximity of PAPL's proposed project to significant known Tribal locations, project construction could potentially harm archaeological and/or culturally, historically and religiously significant sites and artifacts. Such negative impacts would be irreversibly devastating, potentially annihilating artifacts from and evidence of the Tribe's past and erasing significant sites and locations.

NAT2-2 Despite the significant impacts such a project would have on CTOL, the Draft EIS fails to mention the Louisiana Connector Project's potential negative impacts on the Coushatta Tribe of Louisiana's cultural resources. In fact, the DEIS fails to identify *any* potential negative impacts on Tribal cultural resources, and accordingly fails to analyze those impacts or require mitigation measures to address them.

The following comments begin with a section detailing the Coushatta Tribe of Louisiana's nexus to the lands underlying the Louisiana Connector Project corridor. Section II discusses the ways in which the Louisiana Connector Project could devastatingly impact CTOL's

NAT2-1 Section 4.10.3.2 of the final EIS has been updated to include a brief history of the Coushatta Tribe of Louisiana and an acknowledgment that potential artifacts could be encountered during construction of the Louisiana Connector Project.

NAT2-2 Section 4.10 of the final EIS has been updated to include an acknowledgement that potential cultural resources of the Coushatta Tribe of Louisiana could be encountered during construction of the Louisiana Connector Project. Additionally, per agreements between PAPL and the Coushatta, PAPL has agreed to sponsor a tribal monitoring program that would hire monitors trained by the Coushatta to identify any tribal and cultural artifacts uncovered during construction. PAPL filed a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005).

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

cultural resources and outlines the mitigation measures necessary to address the project's anticipated negative impacts. Finally, Section III addresses specific sections in the DEIS that require revision and proposes concrete ways in which those sections should be revised.

In considering and implementing the recommendations below, the FERC is required under federal law to protect and promote CTOL's interests. The Supreme Court has long held that the federal government has trust responsibility to Indian tribes and that federal agencies are required to protect Tribal interests. See, e.g., *Cherokee Nation v. Georgia,* 30 U.S. 1, 17 (1831). Nearly every piece of modern legislation dealing with Indian tribes contains a statement reaffirming the trust relationship between tribes and the federal government. See, e.g., 25 U.S.C. § 458cc, 25 U.S.C. § 3101, 25 U.S.C. § 3701, 25 U.S.C. § 4043, and 20 U.S.C. § 7401. Indeed, the FERC's own policy statement acknowledges the FERC's trust obligations toward Indian tribes: "The Commission acknowledges that, as an independent agency of the federal government, it has a trust responsibility to Indian tribes and this historic relationship requires it to adhere to certain fiduciary standards in its dealings with Indian tribes." 18 C.F.R §2.1c(b).

Before turning to a description of CTOL's historic settlement along the project route, we note that one portion of the proposed pipeline is slated to run directly through the Coushatta Tribe of Louisiana's present-day federal Indian trust land. CTOL has jurisdiction over that land and, accordingly, PAPL will be required to obtain certain Tribal permits as a condition of its construction on that land. It will also be required to negotiate a Right of Way. Further, while working on Tribal land, PAPL will be subject to Tribal jurisdiction. While the majority of proposed revisions in Section III focus on cultural resources issues, some of the proposed revisions focus on ensuring that construction occurring on CTOL's federal Indian trust lands complies with CTOL law, permit requirements, and sovereignty.

I. COUSHATTA TRIBE OF LOUISIANA – HISTORIC SETTLEMENT ALONG THE PROJECT CORRIDOR

NAT2-3 The historic record clearly indicates that the Coushatta people lived along the proposed Louisiana Connector Pipeline corridor for centuries. Indeed, archaeologists and historical linguists place the Coushatta as the northernmost Muskogean group in the Mississippi River valley even prior to recorded European contact (i.e., prior to 1540).[1] Historians further agree that

[1] Examples of cartographic evidence include "Franquelin's 1684 map of Louisiana" which identifies the Tennessee River as the "Caskenampo" River, which means "Many Warriors" in Koasati, the Coushatta Tribe of Louisiana's native language (which is still spoken today among Tribal members). The names of the towns on the Upper Tennessee River were also listed as Caskenampo. The map is available at https://www.loc.gov/resource/g3300.ct000656/?r=0.297,0.301,0.392,0.238,0. Further, the Crisp et.al. Map of 1711 labels the Little Tennessee River as the "River of the Cussates and Hockeleges," and is titled "A compleat [sic] description of the province of Carolina in 3 parts : 1st, the improved part from the surveys of Maurice Mathews & Mr. John Love : 2ly, the west part by Capt. Tho. Nairn : 3ly, a chart of the coast from Virginia to Cape Florida." This map may is available at https://www.loc.gov/item/2004626926/. In addition, the Moll map of 1720 also affirms this location for

NAT2-3 (cont'd)

Spanish explorer Hernando DeSoto encountered the Coushatta in 1540 when they were living on islands in the Tennessee River[2]. In the century following this meeting, the Coushatta migrated to the south in search of better arable lands, as well as to avoid the encroachment of Anglo-European settlers.[3]

In 1701, French explorers encountered the Coushatta within the territory of French Louisiana.[4] During the eighteenth century, all of the colonial groups and numerous explorers

---

the Koasati, and also labels the river as "Cussattees or Thegalogos River." The map is available at https://www.loc.gov/resource/g3300.ct000677/?r=0.408,0.278,0.233,0.149,0.

For information on the DeSoto route and early contact between Indians and Europeans, see Hudson, C., *Knights of Spain, Warriors of the Sun* (Univ of Georgia Press, 1997), as well as Hudson, C. & Tesser, C.C., *The Forgotten Centuries: Indians and Europeans in the American South, 1521-1704* (Athens: University of Georgia Press, 1994).

The most complete study on the pre-contact archaeology of the region may be found in Jurney, D., *Diaspora of the Alabama-Koasati Indians across Southeastern North America,* Ph.D. dissertation, Southern Methodist University, December 2001. Jurney and others combine archaeological, historical, and linguistic evidence to place the Koasati within the Dallas, and possibly Mouse Creek archaeological phases in the region. It is also significant that the entire body of Creek Chiefs told President Jefferson's surveyors that they identified the northernmost border of Creek territory as running from "Old Casauda Town on Casauda Island in the Tennessee River" (National Archives, Papers of the War Department, Letters Received by the Office of the Secretary of War Relating to Indian Affairs, 1800-1823," Roll 1, Folder 2, Section J.)

NAT2-3 (cont'd)

and cartographers identify Coushatta villages and hunting camps within the area of French, and later Spanish, colonial Louisiana, i.e., in modern day towns along the proposed project corridor.[5]

Although additional groups of Koasati had migrated to French Louisiana in 1766 at the conclusion of the French and Indian war,[6] the majority of Koasati people at that time still lived in villages located on the Coosa and Tallapoosa rivers near the present-day town of Coosada, Alabama (named for the Tribe). During this time period, the Coushatta were affiliated with the Creek Confederacy, though they maintained their cultural and linguistic independence.[7] In 1797 and 1804, two large group of Coushatta migrated to the Opelousas district in Spanish-controlled Louisiana, comprised of present-day Acadia, Evangeline, St. Landry, Allen, Jeff Davis and Calcasieu Parishes. Over the next fifty years, Coushatta villages were located throughout the PAPL proposed corridor in Louisiana and Texas, including in the Calcasieu River drainage basin, Sabine River basin, Lower Trinity River basin and Mermentau River Basin (including Bayou Nezpique). These villages were predominately located in what was then known as the Neutral Territory, on lands outside the control of French, Spanish, and American colonial governments.[8] In these villages the Coushatta people lived, occupied seasonal hunting camps,

---

tribes, which they were careful to identify. On May 28, 1701, the French expedition noted: "On the banks of the River there are 36 nations of Savages in different villages, including Alebamons and Conchaque" (a common French spelling for Koasati). Upon his return to France, Iberville later wrote about this encounter that "The Conchaques and Alibamons … villages may consist of four hundred families; the greater part have guns, are friends of the English and will shortly be ours." Conrad, G. R., ed., *The Historical Journal of the Establishment of the French in Louisiana, 1698-1723,* USL History Series Number 3, Lafayette, LA: 1971, pg. 60.

[5] For example, see Knight, V.J. Jr. and Adams, S. L, "A Voyage to the Mobile and Tomeh in 1700," *Ethnohistory,* xxviii (l 981), pp. 179-194; Conrad 1971, p.17; Swanton, J.R., *Early History of the Creek Indians and Their Neighbors* (Bureau of American Ethnology, Bulletin 73, 1922: 202); Crane, Verner W., *The Southern Frontier. 1670-1732* (Ann Arbor: University of Michigan Press), p. 78; Moore Alexander, *Nairne's Muskhogean Journals, The 1708 Expedition to the Mississippi River* (Jackson: University Press of Mississippi, 1988); McDowell, W.L. Jr., *Documents relating to Indian Affairs, in Colonial Records of South Carolina, 1754-1765* (Columbia: University of South Carolina Press,1970); Villiers du Terrage, Marc de.. *Documents Concernat l'histoiredes Indians de la region orientate de la Louisiana* (Paris: Au siege de la Societe, 1922).

[6] Precis du rensencement general de la Louisiana, [1766], Audencia de Santo Domingo, legajo 2585. Additionally, the January 1766 Census of the Opelousas Post in Louisiana territory included "Alibamons that had been established for one year." Both French and Spanish colonial governments referred to the Koasati, Pacana, Abihka, and Alabama collectively as "Alibamons."

[7] Langley, Linda, "The Tribal Identity of Alexander McGillivray: A Review of the Historical and Ethnographic Data," *Louisiana History: The Journal of the Louisiana Historical Association*, 46, no. 2 (Spring 2005): 231-239.

[8] In 1800 the Spanish government had identified two Coushatta villages on the eastern shores of the Sabine River (AGI, Cuba, legajo 217A, folio 560). Carter, C.E., *The Territorial Papers of the United States, Volume IX: The Territory of New Orleans, 1803-1812* (Washington, D.C.: Government Printing Office, 1940), p. 63. Support for the fact that the Caddo gave permission for the Koasati to settle on their ancestral lands at the Red River may be found in Morse, J., *A Report to the Secretary of War of the United States on Indian Affairs, 1822* (Michigan: Scholarly Press, reprinted in 1972),

NATIVE AMERICAN TRIBES COMMENTS

NAT2-3 (cont'd)

raised their children, buried their dead, and worshipped. Oral histories and other primary documents collected by the Coushatta Tribe place these villages at various locations along the proposed project corridor, including the present-day towns of Opelousas, Basile, Elton, Indian Village, Hickory Flats, DeQuincy, Lake Charles and Sulphur Louisiana. The Coushatta Tribe has identified possible archaeological sites and traditional cultural properties throughout the Sabine, Calcasieu and Houston River valleys, along Sabine Lake, along the Creole Trail, and throughout Bayou Blue, Bayou Nezpique, and Bayou Cannes. The Coushatta Tribe's predictive model yields an extremely high likelihood that archaeological sites and other cultural resources exist along the entirety of the proposed route.[9]

After the conclusion of the American Civil War and Texas fight for statehood, the Coushattas returned to Louisiana to live in villages near the present-day town of Indian Village, near Kinder, Louisiana. From there they took advantage of existing laws to get homestead lands

---

p. 257. See also Flores, D.L., "The Red River Branch of the Alabama-Coushatta Indians: An Ethnohistory," *Southern Studies,* Spring, 1977, p. 58-60 and Sibley, John, "Historical Sketches of the Several Tribes in Louisiana South of the Arkansas River and Between the Mississippi and Rio Grande" in *American State Papers Relating to Indian Affairs, vol. IV,* p. 724. In June 1807 Indian agent for the Territory of Orleans John Sibley reported that the Coushatta "Were cutting up their corn at their village on the Sabine and were going to abandon it." Berlandier, J.L., *The Indians of Texas in 1830,* Edited and Introduced by John C. Ewers (Washington, D.C.: Smithsonian Institution Press, 1969), pp. 35, 124, 174, Plate 11. Berlandier noted: "Among other peoples, the wife becomes a comrade to her husband, willingly sharing his sorrows and his labors. Unfortunately, this attitude is to be seen only among the Conchates." *The Report of J. Francis Madero, Commissioner of the State of Coahuila and Texas,* in Fomento Archivo, Legajo no. 4, Exp. 10, reproduced from the Holdings of the Texas State Archives. The original report is in Spanish; this translation is found in Smither, H. "The Alabama Indians of Texas," *Southwestern Historical Quarterly* 36 (1932): 83-108. Throughout the Koasati are continuously referred to as a "pacifico" or friendly tribe. Winfrey, D.H., *Texas Indian Papers, Vol. I* (Austin: Texas Printing Office, 1959).

[9] This predictive model includes factors used in locating Coushatta villages from A.D. 1500 on, including but not limited to high elevation, access to both fast-moving and slower moving waterways (often near river bends and islands), arable lands ideal for growing corn, defensible positions, and location in politically neutral Territories. Although the Coushatta's historic choices to live peacefully and diplomatically in the neutral territories between warring groups has made it more difficult to locate their "footprint" during the mid-19th century, noted Texas historian Howard N. Martin has identified the Tribe's movement during this time based on a review of over 3,000 Texas land grants. In the Handbook of Texas history, available at https://tshaonline.org/handbook/online/articles/exc05, Martin states:

> "The Coushatta Trace and the Atascosito Road were the most important roads through Austin's colony… The [Coushatta] trail extended from the Coushatta village on the Sabine River through the area of ten present Texas counties and merged with the Atascosito Road in Colorado County. From the Coushatta village on the Sabine River, one major trail led eastward to Opelousas, Louisiana, and another, the Coushatta-Nacogdoches Trace, extended northwestward to the post of Nacogdoches, where the Coushattas traded and received presents from the Spanish. The Coushatta Trace began at the village on the Sabine and proceeded through the area of present Newton and Jasper counties, using the same path as the Coushatta-Nacogdoches Trace."

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-3 (cont'd) along Bayou Blue, three miles north of Elton, Louisiana, and ultimately the federal government took land into trust for the Tribe in this area.

The United States Government has long recognized and acknowledged the Coushatta Tribe's migrations, which create an historic nexus to the lands at issue in the PAPL application, most recently in the Congressional Record. *See* 164 Cong. Rec. S4502 (daily ed. June 27, 2018) (Statement of Senator Cassidy and Senator Kennedy) (acknowledging the Coushatta Tribe's history and its migration from Tennessee to Texas and back to Louisiana). The federal government's acknowledgment and recognition of Coushatta's migrations is centuries-long.[10]

In short, the Coushatta Tribe of Louisiana's well-established historical record clearly indicates that, for centuries, the Tribe settled along lands that are within the proposed project corridor.

II. ANTICIPATED NEGATIVE IMPACTS AND PROPOSED MITIGATION MEASURES

NAT2-4 Given the Coushatta Tribe of Louisiana's historic settlement along the proposed project corridor, project construction could potentially harm archaeological and/or culturally, historically and religiously significant sites and artifacts. Such negative impacts would irreversibly damage the Tribe's cultural heritage and the moral fabric of its community, potentially annihilating artifacts from and evidence of the Tribe's past and erasing significant sites and locations. The FERC has a federal trust responsibility to the Tribe to mitigate this potential harm to the greatest extent possible.

In order to mitigate these potentially devastating negative impacts, all ground-disturbing construction activities must be monitored by specially-trained Tribal cultural resource monitors tasked with visually monitoring all ground-disturbing construction activities to determine whether any cultural resources are present. The specialized training required of cultural resource monitors ensures their expertise and professionalism in identifying sites, artifacts and locations that are significant to tribes in general and to the Coushatta Tribe of Louisiana in particular. The presence of such monitors serves two purposes. First, it ensures that to the extent cultural resources are uncovered during construction, individuals trained to identify such resources will be on hand to identify them as such. Second, it ensures that when cultural resources are uncovered and disturbed, they can be documented, preserved and removed (assuming removal is possible and permissible under applicable law) in a timely manner and, upon documentation and removal, construction can resume quickly.

[10] *See, e.g.,* Report of Special Agent John Sibley to Congress (American State Papers, vol. 4:724, Washington, D.C.: Gales & Seaton, 1832) (describing Coushatta's migration from "Bayou Chicot, in Opelousas district" to the "river Sabine … on the east bank, where they now live…"); letter from Ernest Stevens, Acting Commissioner of the Bureau of Indian Affairs to Emery A. Johnson, Director of Indian Health Services, Jan. 5, 1971 (describing the Coushatta migration from Tennessee to Texas and Louisiana); memorandum dated June 13, 1973 from Raymond V. Butler, Acting Director, Office of Indian Services, to the Secretary of the Interior (describing the Coushatta people's migration through Louisiana to eastern Texas and back to Louisiana).

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-4 (cont'd)

In addition to Tribal cultural resource monitors, the Coushatta Tribe of Louisiana THPO must be notified immediately upon discovery of cultural resources, and must be meaningfully involved in the process of identifying such resources, documenting them in situ, and determining their disposition.

Taken together, Tribal cultural resource monitoring during construction and the robust involvement of the CTOL THPO will ensure the documentation and preservation of Tribal cultural resources while enabling construction to proceed with as little disruption as possible.

As of this writing, the Coushatta Tribe of Louisiana is working with the applicant, PAPL, to reach an agreement on the terms of an Unanticipated Discoveries Plan reflecting the mitigation measures discussed here. In a meeting held on October 16th between FERC, CTOL and PAPL, PAPL agreed to file any such plan with FERC by the end of December. If a revised Unanticipated Discoveries Plan is filed by PAPL by the December deadline, as per FERC's direction, that plan will become binding on PAPL and should be referenced in the FEIS as proposed in Section III below. If, however, PAPL does not file such a plan as of the December deadline, CTOL will file its own proposed UDP, including Tribal cultural resource monitoring terms and designation of the Coushatta THPO in handling cultural resource finds. Accordingly, in the event CTOL and PAPL do not reach an agreement, CTOL hereby asks that FERC impose the CTOL plan, and full compliance with it, upon PAPL as a condition of any Certificate or other Authorization for the Louisiana Connector Project.

III. PROPOSED REVISIONS TO DRAFT EIS

In light of the above, we request that the DEIS be revised as follows. Insertions are marked by underline and deletions are marked by ~~strikethrough~~.

Proposed Revisions, Executive Summary:

NAT2-5

Page ES-4. The last paragraph on this page should include the following sentence:

In addition, on June 13, 2017, we attended a meeting hosted by the Coushatta Tribe of Louisiana to discuss the project and the FERC process. During this meeting the Coushatta THPO noted that the project raised concerns relating to cultural resources which required further study and analysis. Representatives from PAPL also attended this meeting. On October 16, 2018, we held a government-to-government meeting with the Coushatta Tribe of Louisiana. At that meeting we discussed, among other things, the project's anticipated negative impacts on Tribal cultural resources and mitigation measures necessary to address such impacts. Also on October 16, 2018, we met with the applicant and the Tribe to address cultural resource impacts and mitigation.

NAT2-5 The Executive Summary of the final EIS has been updated to further describe our meetings with the Coushatta Tribe of Louisiana.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-6 **Page ES-5.** Under the heading "PROJECT IMPACTS", in the third paragraph which begins with the words "Construction of the liquefaction Project would result in impacts on ….", add the following:

> "Construction of the Louisiana Connector Project would affect about 2,807 acres of agricultural land, open land, forest land, silviculture land, rangeland, residential land, industrial/commercial land, and open water, of which about 771 acres would be permanently impacted. It would also affect lands to which the Coushatta Tribe of Louisiana has historical, cultural and religious ties, and any Tribal cultural resources located along the project corridor. About 14.7 miles, or 43 percent…"

NAT2-7 **Page ES-5.** The last paragraph under the heading "PROJECT IMPACTS" should read:

> "Based on our analysis, scoping, and agency consultations, the major issues associated with the Projects are impacts on wetlands, visual resources, cultural resources, air quality, noise, and cumulative impacts."

NAT2-8 **Page ES-6.** The following section should be included immediately after the section entitled "VISUAL RESOURCES":

> "CULTURAL RESOURCES
>
> The Louisiana Connector Project corridor is located squarely within lands to which the Coushatta Tribe of Louisiana has extensive historical, cultural and religious ties. The Coushatta people are known to have migrated, temporarily settled and/or lived in and around the project footprint.
>
> A comprehensive account of the Coushatta Tribe of Louisiana's history and nexus to the land at issue is included at Appendix [number]. In summary, the Coushatta Tribe of Louisiana initially moved from their villages in the Tennessee River area and settled in villages in the Guntersville Basin area of what is now northern Alabama, then moved south to join the political organization that became known as the Creek Confederacy. In 1797 the majority of the Coushatta people migrated from Alabama to what was then Spain's Opelousas District (a large Spanish-governed territory prior to the Louisiana Purchase), comprised of present-day Acadia, Evangeline, St. Landry, Allen, Jeff Davis and Calcasieu Parishes, which are squarely within the PAPL project corridor. From there, the Coushattas migrated and settled in several additional locations along the proposed PAPL project corridor, including the Calcasieu River Drainage Basin, Sabine River Basin, Lower Trinity River Basin, and Mermentau River Basin (including Bayou Nezpique). They lived in multiple villages throughout this area, occupied seasonal hunting camps, raised their children, buried their dead, and worshipped in numerous places along this route. The Coushatta Tribe has identified archaeological sites and traditional cultural properties throughout the Sabine, Calcasieu and Houston River

NAT2-6 The Executive Summary is intended to provide an overview of the Projects and does not specifically acknowledge landowners.

NAT2-7 Existing cultural resources and the Projects' potential impacts on cultural resources are addressed in section 4.10 of the final EIS.

NAT2-8 The recommended language has been added to section 4.10.3.2 of the final EIS.

NAT2-8 (cont'd)

valleys, along Sabine Lake, along the Creole Trail, and throughout Bayou Blue, Bayou Nezpique, and Bayou Cannes. The Coushatta people arrived at their current location, in and around the present-day town of Elton, Louisiana, in 1880.

In light of their centuries-long settlement of lands in and around the PAPL project corridor, there exists a significant and strong likelihood that project construction would disturb and irreversibly destroy Tribal cultural resources."

NAT2-9

Page ES-9. If PAPL files a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to issuance of the FEIS, the bullet-point list on page ES-9 should include the following:

- PAPL's proposed Tribal cultural resources monitoring program in its revised Unanticipated Discoveries Plan would adequately address impacts on Tribal cultural resources.

If, however, PAPL *does not file* a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to issuance of the FEIS, the bullet-point list on page ES-9 should include the following:

- The FERC's condition relating to Tribal cultural resource monitoring during construction of the Louisiana Connector Project, presented in section 5.2 of the EIS, would require and ensure that that appropriate mitigation measures adequately address impacts on Tribal cultural resources.

In addition, if PAPL *does not file* a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to issuance of the FEIS, the final paragraph on page ES-9 should state:

"In addition, we developed site-specific mitigation measures that PALNG and PAPL would implement to further reduce the environmental impacts, including impacts to Tribal cultural resources, that would otherwise result from construction and operation of the projects…"

Proposed Revisions, Section 1:

NAT2-10

Page 1-11. The following text should be added at the end of section 1.3.1.2:

"On June 13, 2017, we attended a meeting hosted by the Coushatta Tribe of Louisiana to discuss the project and FERC process with representatives from PAPL. At that meeting the Coushatta THPO provided comment regarding the Coushatta Tribe's concerns relating to Tribal cultural resources throughout the project corridor.

On October 16, 2018 we held a government-to-government meeting with the Coushatta Tribal Council, the governing body of the Coushatta Tribe of Louisiana. That meeting

NAT2-9 The recommended language has been added to the Conclusions section of the Executive Summary in the final EIS.

NAT2-10 The recommended language has been added to section 1.3.1.2 of the final EIS.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-10 (cont'd)

focused primarily on the Tribe's significant historical, archaeological, cultural and religious nexus to the entire pipeline corridor, on the significant Tribal interests that could be negatively impacted during pipeline construction, and on ways such impacts may be mitigated.

Also on October 16, 2018, we met with representatives of PAPL together with Tribal representatives to discuss cultural resource impacts and mitigation issues."

NAT2-11

Page 1-19. Table 1.5-3 indicates that a request for a right of way grant was filed with the Bureau of Indian Affairs as of "June 2018." As of this writing BIA has informed us that no such request has been filed.

In addition, Table 1.5-3 fails to list the Tribal permits PAPL is required to obtain as a condition of construction of that portion of the Louisiana Connector Project slated to traverse the Coushatta Tribe of Louisiana's federal Indian trust land, or even to mention that such permits are required. The Table should, at the very least, indicate that Tribal permits are required prior to construction on Tribal lands.

Proposed Revisions, Section 2:

NAT2-12

Page 2-28. Section 2.4 lists additional plans and measures PAPL would use to avoid or reduce various project impacts. One of the plans listed is the "Unanticipated Discoveries Plan." This reference should be revised to indicate that it refers to that version of the plan that includes Tribal cultural resource monitoring by the Coushatta Tribe. The reference should state:

- *Unanticipated Discoveries Plan (Revised [date])*

To the extent PAPL files a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the FEIS, the bullet point list on page 2-28 should reference that plan as noted above. If, however, PAPL does not file a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the FEIS, the Coushatta Tribe of Louisiana reserves the right to present such a plan and asks that the FEIS recommend that such plan be included as a condition of PAPL's Certificate or Authorization.

NAT2-13

Page 2-48. Section 2.5.1 addresses compliance monitoring. This section addresses the EI's general responsibilities during construction, but does not specifically reference the EI's involvement in cultural resource monitoring or in ensuring the cultural resource monitoring program is properly implemented. Given the sensitivity relating to cultural resource monitoring, this aspect of the EI's work should be specifically called out. Accordingly, the text in the third paragraph on page 2-48 should be revised as follows:

NAT2-11 Table 1.5-3, which lists the environmental permits and authorizations needed for the Louisiana Connector Project, has been updated to acknowledge that tribal permits are required and pending.

NAT2-12 PAPL field a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005).

NAT2-13 The EI is responsible for ensuring that the environmental obligations of the project are implemented, which would include those described in the *Unanticipated Discoveries Plan*.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-13 (cont'd)

"The EI's responsibilities include ensuring the environmental obligations, conditions, and other requirements of permits and authorizations for the Projects are met and that the Unanticipated Discoveries Plan, including its Tribal cultural resource monitoring requirements, are implemented. PALNG's and PAPL's EI's would inspect all construction and mitigation activities to ensure environmental compliance. EI's ~~may~~ would also oversee other cultural resource and/or biological monitors that monitor and evaluate construction impacts on Tribal cultural and other resources as specified in this EIS.

Proposed Revisions, Section 4:

NAT2-14

Page 4-50. Section 4.4, addressing wetlands, does not address the wetlands located on the Coushatta Tribe of Louisiana's federal Indian trust lands because the survey results for those lands had not been filed when the DEIS issued. That survey has been conducted and finalized, and its conclusions regarding wetlands (and other environmental issues) should be included in the Final EIS.

NAT2-15

Pages 4-212, 4-213. Section 4.10.1 addresses cultural resources surveys. The paragraph that begins at the bottom of page 4-212 and continues on page 4-213 describes a Phase I Cultural Resources Survey report conducted for the Louisiana Connector Project and states that the report was provided "to the FERC and Louisiana SHPO."

Importantly, that report was *not* provided to the Coushatta Tribe of Louisiana or its Tribal Historic Preservation Officer prior to its finalization. Further, the report was prepared without any substantive consultation with the Coushatta Tribe of Louisiana's federally-recognized Historic Preservation Officer. Thus, despite CTOL's clear historic nexus to the land at issue in the report, CTOL did not have an opportunity to comment on or contribute to the report or supplement and correct its findings and omissions. Further, even after the report was submitted to the FERC, at which point CTOL became aware of its existence, CTOL asked for a copy of the report but was not given a copy until *after* the draft EIS had issued.

As a result, the Draft EIS was based on a Phase I Cultural Resources report that was fatally flawed: It was focused on lands of tremendous significance to the Coushatta Tribe of Louisiana but was written without substantive consultation with that Tribe, and it completely failed to address the Tribe's historic, cultural and religious interests in and nexus to the lands. In fact, while the report appears to have pulled some paltry and largely insignificant facts about the Coushatta from a tribal website, it does not reflect any significant research on the Tribe or its history or its nexus to the lands at issue in the report. And, more importantly, it fails to discuss CTOL's centuries-long nexus to the land it purported to study. The Coushatta Tribe of Louisiana will file comments on, and supplements to, that report under separate cover.

The text at the very top of page 4-213 should be supplemented as follows:

NAT2-14 This information has not yet been filed with FERC. However, PAPL has filed an application with the USACE, which has jurisdictional authority pursuant to section 404 of the CWA (33 USC 1344) over the discharge of dredged or fill material into WOUS. Section 4.4.2.2 of the final EIS has been updated to note that, based on desktop wetland information provided to FERC and listed in appendix K, the Louisiana Connector Project would cross about 2,893 feet of wetlands on Coushatta tribal trust lands, affecting about 11.6 acres during construction (1.4 acres of PEM wetland and 10.2 acres of PFO wetland) and 5.5 acres (PFO wetland) during operation of the project.

NAT2-15 Section 4.10.1.2 of the final EIS has been updated to acknowledge the status of the cultural resources surveys on Coushatta tribal trust lands.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-15 (cont'd)

"PAPL provided the resulting Phase I Cultural Resources Survey report to the FERC and Louisiana SHPO. After issuance of the DEIS, PAPL also provided a copy of the resulting report to the Coushatta Tribe of Louisiana. Upon reviewing the report the Coushatta Tribe of Louisiana identified significant omissions and inaccuracies in the report's account of Tribal history relating to the project corridor and supplemented the report in a separate filing."

NAT2-16

Page 4-214. Section 4.10.2 addresses PAPL's Unanticipated Discoveries Plan. This section should be revised as follows:

If PAPL files a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the DEIS, the section should state:

"…We requested revisions to the plan. PAPL provided a revised plan which we ~~find~~ initially thought may be acceptable, but which has since proven to be insufficient because it failed to provide for sufficient involvement of the Coushatta Tribe of Louisiana THPO and to require Tribal cultural resource monitoring during ground-disturbing construction activities. ~~In a letter dated December 5, 2017, the Louisiana SHPO concurred with the plan. The Texas SHPO has not commented on the plan.~~ PAPL subsequently provided a further-revised plan, which includes Tribal cultural resource monitoring and adequate involvement of the Coushatta THPO. We find the further revised plan (dated [date]) acceptable. The Coushatta Tribe of Louisiana THPO concurred with the plan."

If PAPL *does not file* a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the DEIS, the section should state:

"…We requested revisions to the plan. PAPL provided a revised plan which we ~~find~~ initially found acceptable, but which has since proven to be insufficient because it failed to provide for sufficient involvement of the Coushatta Tribe of Louisiana THPO and to require Tribal cultural resource monitoring during ground-disturbing construction activities. ~~In a letter dated December 5, 2017, the Louisiana SHPO concurred with the plan. The Texas SHPO has not commented on the plan.~~ We advised PAPL that it should work with the Coushatta Tribe of Louisiana to revise its plan to adequately mitigate anticipated negative impacts on Tribal cultural resources. PAPL failed to revise its plan as required. The Coushatta Tribe of Louisiana submitted a proposed plan that adequately addresses all cultural resource concerns, and we find that plan acceptable. Accordingly, we recommend that the Unanticipated Discoveries Plan attached at Appendix [number] be included as a condition of any Certificate or Authorization issued to PAPL for the Louisiana Connector Project."

NAT2-17

Page 4-215. Section 4.10.3.2 addresses Native American Consultation on the Louisiana Connector Project. The section should be updated as follows, to address the events that occurred

NAT2-16 Section 4.10.2 of the final EIS has been updated to acknowledge the status of the *Unanticipated Discoveries Plan*. PAPL filed a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005).

NAT2-17 Section 4.10.3.2 of the final EIS has been updated to address the government-to-government consultation and revisions to the *Unanticipated Discoveries Plan*.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-17 (cont'd)

after the DEIS issued. Starting with the second paragraph on page 4-215, the text should be revised as follows:

> "We attended a meeting on June 13, 2017, hosted by the Coushatta Tribe of Louisiana and PAPL to discuss the status of cultural resources surveys and to offer the Tribe an opportunity to identify traditional cultural properties or provide comments about the Louisiana Connector Project. The Coushatta Tribe of Louisiana indicated that given its history of having lived along the entire project corridor for centuries, it had significant cultural resource concerns with the project as a whole. The CTOL requested, as a first step, that a traditional cultural properties survey be performed.

The following paragraph, commencing with the words "PAPL separately contacted seven tribes," should similarly be revised to include later developments:

> "…PAPL indicated that it employed Coushatta tribal members to participate in surveys on tribal lands, and that it was willing to employ monitors on Coushatta lands. ~~No additional responses have been received~~.
>
> On June 21, 2018 the Coushatta Tribe of Louisiana notified the FERC in writing that it sought to conduct government-to-government consultations to discuss the Louisiana Connector Project, and specifically to discuss the Project's anticipated negative impacts on Tribal cultural resources. A government-to-government meeting was scheduled for October 16, 2018, as was a three-way meeting, between FERC, the Tribe, and PAPL, to discuss cultural resources issues. On September 7, 2018 Coushatta filed a notice again raising concerns regarding Tribal cultural resources, noting that the DEIS should address those concerns, and asking that the FERC refrain from issuing the DEIS until after the October 16th meetings. The DEIS issued on September 28, 2018.
>
> On October 16, 2018, FERC staff met with the Coushatta Tribe of Louisiana on a government-to-government basis.
>
> Also on October 16, 2018, FERC staff met with representatives of both PAPL and the Coushatta Tribe of Louisiana to discuss the project's potential negative impacts on Tribal cultural resources and on ways to mitigate those impacts. FERC staff advised PAPL that it should work with the Coushatta Tribe of Louisiana to revise its Unanticipated Discoveries Plan to adequately mitigate anticipated negative impacts on Coushatta Tribal cultural resources.
>
> On [date] the Coushatta Tribe of Louisiana filed comments supplementing the previously-filed Phase I Cultural Resources survey which had failed to include relevant historical, cultural and religious information about the Tribe's activity on the project corridor.
>
> On [date] [PAPL filed a revised Unanticipated Discoveries Plan, to which the Coushatta Tribe concurred, that included a Tribal cultural resource monitoring program and adequate notification of the Coushatta THPO in the event of unanticipated discoveries.] *Alternatively*:[Although we advised PAPL that it should work with the Coushatta Tribe

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-17 (cont'd)

of Louisiana to revise its plan to adequately mitigate anticipated negative impacts on Tribal cultural resources. PAPL failed to revise its plan as required. The Coushatta Tribe of Louisiana submitted a proposed plan that adequately addresses all cultural resource concerns, and we find that plan acceptable. Accordingly, we recommend that the Unanticipated Discoveries Plan attached at Appendix [number] be included as a condition of any Certificate or Authorization issued to PAPL for the Louisiana Connector Project.]"

NAT2-18

Page 4-216. The first paragraph in section 4.10.4.2 should be revised as follows:

"The process of complying with section 106 of the NHPA has not been completed for the Texas Connector and Louisiana Connector Projects. PAPL has not completed cultural resources surveys and NHRP evaluations, and consultation with the Texas and Louisiana SHPO's and the Coushatta Tribe of Louisiana THPO is not yet complete."

Further, subsection (a) of the bold-texted recommendation on page 4-216 should be revised as follows:

"a. PAPL files with the Secretary all outstanding survey reports, evaluation reports, special studies, and any required avoidance/treatment plans, and the Texas and Louisiana SHPO's and the Coushatta Tribe of Louisiana THPO's comments (as applicable) on these."

NAT2-19

Page 4-305. Section 4.12.8 includes an analysis of pipeline safety standards. Given that part of the project is slated for construction on the Coushatta Tribe of Louisiana's federal Indian trust lands, over which the Coushatta Tribe of Louisiana has and exercises jurisdiction, the FERC staff's recommendations should include a requirement that the Coushatta Tribe of Louisiana receive the same notifications, and be included in developing the same plans, as other jurisdictions through whose land the pipeline will run.

Thus, for example the final paragraph on page 4-305 discusses a liaison program and meetings with public authorities. The FEIS should explicitly require that CTOL officials be included in the liaison program and consulted in such meetings. Similarly, the first paragraph on page 4-306 discusses the creation of a list of relevant contacts. Coushatta Tribe of Louisiana Tribal officials should be included in that list, including the Tribal Chairperson, Tribal Fire Department, Tribal Police Department, Tribal EMS personnel, and all other relevant Tribal officials and departments. Accordingly, pages 4-305 to 4-306 should be revised to include notification of, and consultation with, CTOL Tribal officials.

NAT2-20

Page 4-341. Section 4.13 deals with cumulative impacts, and section 4.13.2.11 deals specifically with cumulative impacts on cultural resources. The second paragraph of section 4.13.2.11 indicates that PAPL consulted with the Texas and Louisiana SHPOs in regard to the impact of

NAT2-18 Section 4.10.4.2 of the final EIS has been updated to include the recommended language.

NAT2-19 We anticipate that this would include tribal resources (e.g., police, fire, emergency services), but this requirement is under the DOT's jurisdiction, not FERC's; thus, the DOT is the agency responsible for overseeing and enforcing the proper safety notifications. We encourage the Coushatta Tribe of Louisiana to contact PAPL to request this meeting and training.

NAT2-20 Section 4.13.2.11 of the final EIS acknowledges PAPL's development and implementation of a tribal monitoring plan. PAPL filed a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005).

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-20 (cont'd) pipeline projects. However, the Coushatta THPO was not consulted prior to issuance of the DEIS.

As indicated above, the Coushatta Tribe of Louisiana has historic, cultural and religious ties to the entire Louisiana Connector Project construction corridor. Any projects on or crossing that corridor increase the chances of disturbance and destruction of Tribal cultural resources. The greater the number of projects in the affected area, the greater the cumulative negative impacts of such projects on Tribal resources.

Such cumulative impacts would be significantly reduced by the presence of Tribal cultural resource monitors during any ground-disturbing activities performed in the course of construction. Such monitoring should be required either as a part of a filed Unanticipated Discoveries Plan or as a condition of any Certificate or Authorization.

Proposed Revisions, Section 5:

NAT2-21 **Page 5-7.** Section 5.1 includes a summary of the EIS's environmental analysis. Section 5.1.3.3, discussing impacts to wetlands, should be revised to include the impacts to Tribal wetlands described in the phase I environmental survey conducted on the Coushatta Tribe of Louisiana's federal Indian trust land.

NAT2-22 **Page 5-21.** Section 5.1.11 includes a summary of conclusions relating to cultural resources. The section should be revised to address issues such as the Coushatta Tribe of Louisiana's historic, cultural and religious nexus to the Louisiana Connector Project corridor, the requirement that the Coushatta THPO be notified and consulted with regard to all cultural resource issues, and the requirement that a revised UDP, approved by the Coushatta THPO, include a Tribal cultural resource monitoring plan and timely and adequate notification of the Coushatta THPO in the event of an unanticipated discovery.

The second-to-last paragraph on page 5-21 should be revised in one of two ways. If PAPL files a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the FEIS, the paragraph should state:

> "PALNG and PAPL provided FERC and ~~each~~ the Texas SHPO an unanticipated discoveries plan for Texas ~~and Louisiana~~ which would be implemented if cultural resources or human remains are encountered during construction of the Project~~s~~. The plan also provides for the notification of Native American tribes in the event of any discovery. ~~In a letter dated December 15, 2017, the Louisiana SHPO concurred with the plan. The Texas SHPO has not commented on the plan.~~
>
> As to the Louisiana Connector Project, PAPL filed a revised Unanticipated Discoveries Plan on [date], which includes Tribal cultural resource monitoring and adequate involvement of the Coushatta THPO. We find the further revised plan (dated [date]) acceptable. The Coushatta Tribe of Louisiana THPO concurred with the plan."

NAT2-21 Section 4.4.2.2 of the final EIS has been updated to indicate that wetlands would be impacted on tribal lands. Section 5 is meant to provide a general overview of impacts and not the specific analysis contained in section 4.

NAT2-22 Section 5.1.11 of the final EIS has been updated to acknowledge that PAPL filed a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005).

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-22 (cont'd)

If PAPL *does not file* a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the FEIS, the section should state:

> "PALNG and PAPL provided FERC and ~~each~~ the Texas SHPO an unanticipated discoveries plan for Texas ~~and Louisiana~~ which would be implemented if cultural resources or human remains are encountered during construction of the Project~~s~~. The plan also provides for the notification of Native American tribes in the event of any discovery. ~~In a letter dated December 15, 2017, the Louisiana SHPO concurred with the plan. The Texas SHPO has not commented on the plan.~~
>
> As to the Louisiana Connector Project, although we advised PAPL of the need to work with the Coushatta Tribe of Louisiana to file a plan that adequately mitigates anticipated negative impacts on CTOL Tribal cultural resources, PAPL failed to submit a revised plan as required. The Coushatta Tribe of Louisiana submitted a proposed plan that adequately addresses all cultural resource concerns, and we find that plan acceptable. Accordingly, we recommend that the Unanticipated Discoveries Plan attached at Appendix [number] be included as a condition of any Certificate or Authorization issued to PAPL for the Louisiana Connector Project."

NAT2-23

Page 5-22. The first paragraph on page 5-22 should be revised as follows:

> "..which was provided on September 12, 2017. On June 13, 2017, at a meeting with FERC and PAPL hosted by the Coushatta Tribe of Louisiana, the Coushatta THPO provided comment regarding the Coushatta Tribe's concerns relating to Tribal cultural resources throughout the project corridor. In a June 21, 2018 letter, the Coushatta Tribe of Louisiana again raised concerns regarding the project's anticipated impacts on cultural resources and requested government-to-government consultation and a meeting to discuss the project's anticipated negative impacts on Tribal cultural resources and mitigation thereof.
>
> On October 16, 2018 we held a government-to-government meeting with the Coushatta Tribal Council, focusing primarily on the Tribe's significant historical, archaeological, cultural and religious nexus to the entire pipeline corridor, on the significant Tribal interests that could be negatively impacted during pipeline construction, and on ways such impacts may be mitigated. Also on October 16, 2018, we met with representatives of PAPL together with Tribal representatives to discuss cultural resource impacts and mitigation issues. ~~No other responses have been received by FERC to date regarding the Louisiana Connector Project. In addition, we communicated with the Coushatta Tribe of Louisiana in June and August 2018, and have arranged to meet with the Tribe in October 2018.~~

If PAPL files a revised Unanticipated Discoveries Plan that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the FEIS, the next sentence should state:

NAT2-23 Section 5.1.11 of the final EIS has been updated to acknowledge the status of consultations with the Coushatta Tribe of Louisiana.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-23 (cont'd)

> On [date] PAPL filed a revised Unanticipated Discoveries Plan, approved by the Coushatta THPO, that incorporates a Tribal cultural monitoring program intended to address the project's negative impacts on Tribal cultural resources.]

Alternatively, if PAPL does not file a revised Unanticipated Discoveries Plan, that includes an acceptable Tribal cultural resource monitoring program prior to finalization of the FEIS, the next sentence should state:

> On [date] the Coushatta Tribe of Louisiana filed a revised Unanticipated Discoveries Plan that incorporates a Tribal cultural monitoring program intended to address the project's negative impacts on Tribal cultural resources. We find that plan, attached hereto at Appendix [number], acceptable and recommend that it be incorporated as a condition of any Certificate or Authorization issued to PAPL for the Louisiana Connector Project."

The next paragraph, at the end of section 5.1.11, should be revised as follows:

> "Because the process of complying with section 106 of the NHPA has not been completed for the Projects, we are recommending that prior to construction, PALNG and PAPL file all outstanding information, survey reports, evaluation reports, special studies, and plans, and the SHPO's and Coushatta THPO's comments on these."

NAT2-24

Page 5-27. Section 5.2 of the DEIS, commencing at page 5-26, includes FERC staff's recommended mitigation measures. Recommendation number 4, on page 5-27, should be revised as follows:

> "PALNG and PAPL shall file affirmative statement with the Secretary, certified by a senior company official, that all company personnel, EIs, and contractor personnel will be informed of the EI's authority, will undergo training with regard to Tribal cultural resources, and have been or will be trained on the implementation of the environmental mitigation measures (including, without limitation, Tribal cultural resource monitoring and THPO notification) appropriate to their jobs **before** becoming involved with construction and restoration activities."

NAT2-25

Pages 5-28, 5-29. Recommendation number 7, which begins on page 5-27 and continues on page 5-28, should be revised as follows:

> "c. the number of EIs assigned per spread and how PALNG and PAPL will ensure that sufficient personnel are available, including Tribal cultural monitors, to implement the environmental mitigation (including cultural resource mitigation)."

Recommendation number 8 should be revised at subsections b and e to provide:

> "b. responsible for evaluating the construction contractor's implementation of the environmental mitigation measures including the cultural resource mitigation measures, required in the contract (see condition 7) and any other authorizing document.

NAT2-24 PAPL field a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005). Section 3.1 of PAPL's revised *Unanticipated Discoveries Plan* describes the training, orientation, and responsibilities of construction personnel. For example, the EI will devote adequate time to training Project Personnel on identifying the types of Indian tribal archaeological resources they may encounter during Ground-Disturbing Activities, and training will occur as part of the Project's pre-construction on-site training program for PAPL and/or contractor supervisors and inspectors.

NAT2-25 PAPL field a revised *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)* developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005). Section 3.1.2 of PAPL's revised *Unanticipated Discoveries Plan* describes the number of tribal cultural resources monitors (TCRM) that will be used during construction. For example, TCRMs will be present during Ground-Disturbing Activities; to the extent the pipeline route is divided into several concurrent spreads, not less than two TCRMs will perform monitoring activities at each spread; and Coushatta Historic Preservation Office and the EI will work together to determine how many additional TCRMs will be used in additional locations.

The recommended modifications to Environmental Recommendations 8.b and 8.e (with the exception of adding the Coushatta Tribe of Louisiana for Tribal Trust Lands) have not been made as they are already included as part of the broader standard condition.

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

NAT2-25 (cont'd)

e. responsible for documenting compliance with the environmental conditions (including cultural resource conditions) of the Order, as well as any environmental conditions/permit requirements imposed by other federal, state, Coushatta Tribe of Louisiana Tribal, or local agencies; and"

NAT2-26

Page 5-29. Condition number 9 should be revised to include two additional status reports, as follows:

"a listing of all Tribal cultural resources encountered;

a description of actions taken pursuant to any discovery of cultural resources;"

NAT2-27

Page 5-32. Condition number 26, subsection (a), should be revised as follows:

"a. PAPL files with the Secretary all outstanding survey reports, evaluation reports, special studies, and any required avoidance/treatment plans, and the Texas and Louisiana SHPOs' and the Coushatta Tribe of Louisiana THPO's comments (as applicable) on these;"

In addition, if PAPL fails to file a revised Unanticipated Discoveries plan with more robust THPO involvement and Tribal cultural resource monitoring, acceptable to the CTOL THPO, prior to issuance of the FEIS, a further condition should be added to address cultural resource mitigation. One of the following two alternatives should be incorporated after recommendation number 26:

Alternative A:

"PAPL shall **not begin any construction activities** relating to the Louisiana Connector Project unless and until it submits a revised Unanticipated Discoveries Plan, acceptable to the Coushatta Tribe of Louisiana THPO, that provides for more robust involvement of the CTOL THPO upon discovery of cultural resources and that requires Tribal cultural resource monitoring at each construction location."

Alternative B:

"PAPL shall be required to fully implement the Unanticipated Discoveries Plan recommended by FERC staff and attached hereto at Appendix [number]." *If alternative B is adopted, FERC staff should adopt and attach as an appendix to the FEIS the Unanticipated Discoveries Plan submitted by the Coushatta Tribe of Louisiana.*

IV. CONCLUSION

Given the proximity of PAPL's proposed project to significant known Tribal locations, project construction could potentially harm archaeological and/or culturally, historically and

NAT2-26 If something is found, PAPL would report it to the appropriate personnel in accordance with the *Unanticipated Discoveries Plan*; however, these status reports are not the appropriate venue because they are public documents.

NAT2-27 This condition has been revised to reflect the recommended update. PAPL has agreed to adopt the changes requested by the tribe in its *Unanticipated Discoveries Plan (For Project Facilities within the State of Louisiana)*, developed with the Coushatta Tribe of Louisiana on January 15, 2019 (FERC Accession No. 20190116-5005).

NATIVE AMERICAN TRIBES COMMENTS

20181120-5009 FERC PDF (Unofficial) 11/19/2018 5:16:51 PM

religiously significant sites and artifacts. Such negative impacts would irreversibly devastate Tribal mores and cultural heritage by potentially annihilating artifacts from and evidence of the Tribe's past. The United States' trust responsibility to the Coushatta Tribe requires the government generally, and the Federal Energy Regulatory Commission specifically, to protect the Coushatta Tribe of Louisiana's cultural, historic and religious interests in the lands underlying the PAPL project corridor. And federal law similarly requires protection of these interests and of the cultural, historical and religious sites and artifacts to which they are tied. *See* American Indian Religious Freedom Act of 1978; Archaeological Resources Protection Act of 1979; National Environmental Policy Act of 1969; National Historic Preservation Act of 1966; and Native American Graves Protection and Repatriation Act of 1990. Adopting the changes proposed above would enable the FERC to fulfil its trust obligations toward the Coushatta Tribe of Louisiana. Accordingly, the Tribe respectfully requests that the FERC implement the changes noted above.

The Coushatta Tribe of Louisiana appreciates the opportunity to provide comment on the DEIS.

If you have any questions or require further clarification, feel free to contact me.

Sincerely,

Linda Langley

RE: Port Arthur LNG, LLC, Docket No. CP17-20-000
Port Arthur Pipeline, LLC, Docket No. CP17-21-000
Port Arthur Pipeline, LLC, Docket No. CP18-7-000

Dear Ms. Bose:

On November 29, 2016, Port Arthur LNG, LLC and PALNG Common Facilities Company, LLC (collectively known as PALNG) along with Port Arthur Pipeline, LLC (PAPL) submitted applications under Section 3(a) and Section 7(c) of the Natural Gas Act for the construction and operation of a new LNG liquefaction facility (PALNG Project) and for the construction and operation of a new feed gas pipeline (PAPL Texas Connector or PAPTC) near Port Arthur, Texas. On October 16, 2017, PAPL submitted an application under Section 7(c) for the construction and operation of an additional feed gas pipeline (PAPL Louisiana Connector or PAPLC). In today's submittal, PALNG and PAPL are providing additional information related to these projects, comments to the Draft Environmental Impact Statement (EIS) and responses to Draft EIS conditions.

Attachment 1 – *Supplemental Information*

Attachment 2 – *Comments on Draft EIS*

Attachment 3 – *Responses to Draft EIS Conditions*

Please note that some of the material filed herein contains Privileged and Confidential Information ("PRIV"). Portions of Attachment 1 include documents that contain proprietary information and/or PRIV. Pursuant to Section 388.112 of the Commission's regulations, Port Arthur LNG requests that the Commission treat this information as privileged material. The information included in these attachments meets the Commission's definition of privileged material and treatment of this information as privileged is therefore warranted. Port Arthur LNG is submitting a public version of this filing, with the privileged material redacted. The privileged material has been labeled accordingly and is not to be released. Port Arthur LNG previously filed a proposed form of Protective Order and Non-Disclosure Certificate in this proceeding on November 29, 2016.

For questions concerning this submittal please contact Jim Thompson at 832-284-5685. Thank you for your attention to these matters.

Respectfully submitted,

/s/JD Morris

Re: Draft Phase I Report
La Division of Archaeology Report No. 5727-1
Phase I Cultural Resources Investigation of a Portion of the Proposed Port Arthur Pipeline, Louisiana Connector within Coushatta Tribe of Louisiana Trust Land in Allen Parish, Louisiana

Dear Peter Cropley:

We acknowledge receipt of your letter dated August 17, 2018 and two copies of the above referenced report. We have completed our review of this report and have the following comments to offer:

Include the name and address of the Lead Federal Agency on the Title Page.

Based on the description of the Area of Potential Effect (APE), the proposed ground-disturbing activities, and the identification of historic properties within the APE, our office concurs with the assessment that no properties listed in or eligible for listing in the National Register of Historic Places will be affected by this project. Our office has no further concerns for this project.

Consultation with the State Historic Preservation Office does not constitute consultation with Tribal Historic Preservation Offices, other Native American tribes, local governments, or the public. If archaeological materials are encountered during construction, the procedures codified at 36 CFR 800.13(b) will apply. Archaeological materials consist of any items, fifty years old or older, which were made or used by man. These items include but are not limited to, stone projectile points (arrowheads), ceramic sherds, bricks, worked wood, bone and stone, metal, and glass objects. The federal agency or the applicant receiving federal assistance should contact our office immediately. If human remains are encountered, the provisions of the Louisiana Unmarked Human Burial Sites Preservation Act (Revised Statute 8:671-681) should be followed.

Please note that the Divisions of Historic Preservation and Archaeology have published new standards for field investigations and reports effective for all projects initiated after 1 September 2018. The revised standards can be found at https://www.crt.state.la.us/cultural-development/archaeology/section-106/2018-standards/index.

Jim,

APP1-4 (cont'd)

I wanted to follow up on last week's meeting to let you know that the Tribe has no comments on the Phase I environmental report relating to Coushatta Tribal trust lands. We did have some comments on the CR report relating to Tribal trust lands and we provided those to Goodwin & Associates.

As we discussed, we do have comments on the Phase I CR report relating to non-Tribal lands, and we will be filing those comments on the record within a few weeks.

Thank you,

Linda Langley, Ph.D.
Tribal Historic Preservation Officer
Coushatta Tribe of Louisiana

Linda,

Good morning! I reread your email and noticed you mentioned the comments sent to RC Goodwin on the cultural survey done for the Tribal trust lands. I just want to make sure you are OK with the updated version of that report I sent to you last month. I'm getting ready to send updated information and comments on the DEIS to FERC and didn't want to include this report if you're not OK with it.

If I need to resend, please let me know.

Thanks,

Jim

Port Arthur Liquefaction Project
Port Arthur Pipeline Texas Project
Port Arthur Pipeline Louisiana Project

Attachment 2
Comments on the Draft EIS

1. PALNG and PAPL is providing comments to the Draft EIS as described herein.

APP1-5

2. Response to comment submitted to FERC by Mr. Ken Teague regarding alternative site for the PALNG Liquefaction Project.

   PALNG reviewed the suggested location along the Calcasieu River identified by Mr. Ken Teague in his comments to the DEIS dated 11/01/2018. PALNG reviewed Mr. Teague's suggested alternative location in its *"Alternative Analysis for the Port Arthur Liquefaction Project,"* submitted to FERC on 09/15/2017 in response to Staff's 02/17/2017 Data Request No. 126. Furthermore, PALNG has reviewed the proposed location's availability of sale and determined the property is owned by the Lake Charles Harbor and Terminal District and the properties on the north bank are currently leased.

APP1-6

3. Response to comment submitted to FERC by Mr. Chester Wimberly regarding an alternative route for the PAPLC Project near MP 128.5 to MP 130.7

   PAPLC reviewed the proposed alternative route suggested by Mr. Chester Wimberly in his comments to the DEIS dated 10/22/2018 and provides the attached *Comparison of the Proposed Route to the Chester Wimberly Alternative Route Table* to describe the potential impacts from each. Please note this evaluation is based on a hand drawn route suggested by Mr. Wimberly and has not received constructability evaluations by PAPL. Should this alternative route be selected by FERC as the approved route, PAPL reserves the right to adjust the route and add additional workspace as needed and approved by FERC staff prior to construction.

APP1-5 Comments noted. See response to comment IND5-1.

APP1-6 Comments noted. Section 3.4 of the final EIS has been updated to include the relevant information for this alternative.

Port Arthur LNG

Port Arthur Pipeline

	No.	Section	PALNG/PAPL DEIS Commitment	PALNG/PAPL Response
APP1-7	1.	2.1.1.2	PALNG would install a berm (i.e., 20-foot storm surge barrier) around the LNG storage tank area to prevent liquid in the storage tank area from flowing off-site in the event of an outer tank impoundment failed.	PALNG proposes to use full containment tanks which provides secondary containment for stored LNG. The facility will have storm surge berms that will act as tertiary containment in the unlikely event of an outer tank failure.
APP1-8	2.	2.4.1.1	Concrete berms with a height of 20 feet AMSL would be constructed around all areas containing critical process equipment, including the liquefaction trains and LNG storage tanks.	PALNG will construct earthen berms, and not concrete.
APP1-9	3.	2.4.1.2	The remaining 2.9 million yd3 of dredge material would be transported to the J.D. Murphree WMA using a temporary 30-inch-diameter aboveground pipeline floated in Round Lake Canal (see figure 2.1.1-3).	PALNG estimates the quantity to be placed on the J.D. Murphree WMA to be 2.4 million yd^3.
APP1-10	4.	4.2.1.6	Prior to construction of the Liquefaction Project, PALNG should provide the EPA, USACE, TCEQ, and Texas RRC the soil and sediment analysis conducted at the area within the ship canal at the marine berth, construction dock, MOF, and landward component of the MOF for review. PALNG should file the conclusions of the reviews with the Secretary along with documentation of its consultations with these agencies including any measures PALNG would need to adopt if the analysis discovers previously unknown contamination.	The commitment to sample and perform sediment analysis of the marine berth, construction dock, MOF and landward component of the MOF for agency review was made in PALNG's application in response to comments received during Pre-filing. Subsequently a Tier 1 Evaluation Report was conducted. This report was provided to Staff with PALNG's supplemental clarification filing dated January 8, 2018. This same report was submitted to the USACE on November 13, 2017. The Tier 1

1

APP1-7 Section 2.1.1.2 of the final EIS has been updated to clarify that the primary function of the 20-foot storm surge barrier is not secondary containment.

APP1-8 Section 2.4.1.2 of the final EIS has been updated to indicate the berms are earthen.

APP1-9 Section 2.4.1.2 of the final EIS has been updated to indicate 2.4 million yd^3 would be placed on the J.D. Murphree WMA.

APP1-10 FERC acknowledges that the Tier I Evaluation Report has been provided to the USACE; however, the report also needs to be submitted to the EPA, TCEQ, and Texas RRC. Further, the conclusions of all four agencies' reviews and any subsequent agency recommendations should be filed with the Secretary.

APP1-10 (cont'd)

			Evaluation Report analyzes all sampling events performed by PALNG as well as sediment sampling completed by others. The report concludes no additional sampling or analysis is required. If the USACE requires additional sampling and analysis, PALNG will complete this as required.

APP1-11

5.	4.5.2.1	Vegetation would be removed at the ground surface using mechanical or manual methods, or a combination of the two (vegetation would not be burned).	PALNG has also identified burning as a means of vegetation disposal in its application (RR 1, Section 1.3.2) in accordance with TCEQ requirements.

APP1-11 Section 4.5.2.1 of the final EIS has been updated to include the option of vegetation burning.

Responses to Draft EIS Conditions

APP1-13

1. DEIS Condition 19.
   Prior to the close of the draft EIS comment period, PALNG and PAPL shall file with the Secretary updated wetland impact data for the Projects to ensure accuracy, as well as consistency with the wetland data provided to the USACE as part of PALNG's and PAPL's permit applications. The updated data shall be filed with the FERC using the same format and wetland classification system/definitions as submitted to the USACE.

   Response:

   PALNG and PAPL provides the attached updated Table 4.4.2-1 Wetlands Affected by the Projects, that provides impact data for the Projects to ensure accuracy, as well as consistency with the wetland data provided to the USACE as part of PALNG's and PAPL's permit applications. The updated data uses the same format and wetland classification system/definitions as submitted to the USACE.

APP1-14

2. DEIS Condition 30.
   Prior to the end of the draft EIS comment period, PALNG shall file with the Secretary documentation demonstrating it has filed for an Aeronautical Study under 14 CFR 77 for all permanent structures, temporary construction equipment, and mobile objects that exceed the height requirements in 14 CFR 77.9.

   Response:

   PALNG has e-filed applications demonstrating it has filed for an Aeronautical Study under 14 CFR 77 for all permanent structures, temporary construction equipment, and mobile objects that exceed the height requirements in 14 CFR 77.9. A summary page identifying these applications is being provided herein.

   PALNG submitted an application for the LNG vessels though they do not exceed the height requirements in 14 CFR 77.9.

APP1-13 Section 4.4.2.1 of the final EIS has been updated with the provided data.

APP1-14 FERC has received PALNG's Aeronautical Study, and this Environmental Recommendation has been removed from the final EIS.

[a] Construction and operation impacts are based on the typical construction and permanent rights-of-way widths (125 feet, 110 feet, 50 feet, etc.) and workspace areas as discussed in section 2.2. The HDD method would be used to avoid direct impacts on wetlands at various locations, as listed in table 2.4.3-1. Most wetland types would be allowed to revert to pre-construction conditions, and limited vegetation maintenance would be allowed in wetlands during project operations.

[b] The South Compressor Station and Centana and PALNG laterals would be within the liquefaction site boundaries and, therefore, their impacts on wetlands are included as part of the impacts for the Liquefaction Project.

RE: Port Arthur LNG, LLC, Docket No. CP17-20-000
Port Arthur Pipeline, LLC, Docket No. CP17-21-000
Port Arthur Pipeline, LLC, Docket No. CP18-7-000

Dear Ms. Bose:

APP2-1

On November 29, 2016, Port Arthur LNG, LLC and PALNG Common Facilities Company, LLC (collectively known as PALNG) along with Port Arthur Pipeline, LLC (PAPL) submitted applications under Section 3(a) and Section 7(c) of the Natural Gas Act for the construction and operation of a new LNG liquefaction facility (PALNG Project) and for the construction and operation of a new feed gas pipeline (PAPL Texas Connector or PAPTC) near Port Arthur, Texas. On October 16, 2017, PAPL submitted an application under Section 7(c) for the construction and operation of an additional feed gas pipeline (PAPL Louisiana Connector or PAPLC). In today's submittal, PALNG and PAPL are providing additional information related to these projects, comments to the Draft Environmental Impact Statement (EIS) and responses to Draft EIS conditions.

Attachment 1 – *Supplemental Information*

Attachment 2 – *Comments on Draft EIS*

Attachment 3 – *Responses to Draft EIS Conditions*

Please note that some of the material filed herein contains Privileged and Confidential Information ("PRIV"). Portions of Attachment 1 include documents that contain proprietary information and/or PRIV. Pursuant to Section 388.112 of the Commission's regulations, Port Arthur LNG requests that the Commission treat this information as privileged material. The information included in these attachments meets the Commission's definition of privileged material and treatment of this information as privileged is therefore warranted. Port Arthur LNG is submitting a public version of this filing, with the privileged material redacted. The privileged material has been labeled accordingly and is not to be released. Port Arthur LNG previously filed a proposed form of Protective Order and Non-Disclosure Certificate in this proceeding on November 29, 2016.

For questions concerning this submittal please contact Jim Thompson at 832-284-5685. Thank you for your attention to these matters.

Respectfully submitted,

/s/JD Morris
JD Morris
Director, Permitting & Compliance
On behalf of PALNG and PAPL

Port Arthur LNG, LLC PALNG Common Facilities Company, LLC	Docket No. CP17-20-000
Port Arthur Pipeline, LLC	Docket Nos. CP17-21-000 CP17-21-001 CP18-7-000

ORDER GRANTING AUTHORIZATIONS UNDER SECTIONS 3 AND 7 OF THE NATURAL GAS ACT

(Issued April 18, 2019)

1. On November 29, 2016, in Docket No. CP17-20-000, Port Arthur LNG, LLC and PALNG Common Facilities Company, LLC (collectively, Port Arthur LNG) filed an application for authorization under section 3 of the Natural Gas Act (NGA)[1] and Part 153 of the Commission's regulations[2] to site, construct, and operate new facilities for the export of liquefied natural gas (LNG) in the vicinity of Port Arthur, Texas (Liquefaction Project).

2. On the same day, Port Arthur Pipeline, LLC (Port Arthur Pipeline) filed an application in Docket No. CP17-21-000, under NGA section 7(c)[3] and Parts 157[4] and 284[5] of the Commission's regulations, for a certificate of public convenience and necessity to construct and operate a new natural gas pipeline system designed to transport

[1] 15 U.S.C. § 717b (2012).

[2] 18 C.F.R. pt. 153 (2018).

[3] 15 U.S.C. § 717f (2012).

[4] 18 C.F.R. pt. 157 (2018).

[5] 18 C.F.R. pt. 284 (2018).

(continued ...)

up to 2,000,000 million British thermal units (MMBtu) of natural gas per day from interconnections in Cameron Parish, Louisiana, and Orange and Jefferson Counties, Texas, to the Liquefaction Project (Texas Connector Project).

3. On October 16, 2017, Port Arthur Pipeline filed an application in Docket No. CP18-7-000, under NGA section 7(c)[6] and Parts 157[7] and 284[8] of the Commission's regulations, for a certificate of public convenience and necessity to construct and operate an additional new natural gas pipeline system designed to transport up to 2,000,000 MMBtu of natural gas per day originating in Eunice Parish, Louisiana, to serve as another source of feed gas for the Liquefaction Project (Louisiana Connector Project).

4. On November 7, 2017, Port Arthur Pipeline filed an amendment to the Texas Connector Project application in Docket No. CP17-21-001 which updated and revised Port Arthur Pipeline's *pro forma* tariff and initial rates as a result of the Louisiana Connector Project (Amendment Application).

5. Port Arthur Pipeline also requests blanket certificates under Part 284, Subpart G of the Commission's regulations to provide open-access transportation service, and under Part 157, Subpart F of the Commission's regulations to perform certain routine construction activities and operations, for the Louisiana Connector and Texas Connector projects.

6. For the reasons discussed in this order, we will authorize Port Arthur LNG's proposal under section 3 to site, construct, and operate the Liquefaction Project. We will also authorize Port Arthur Pipeline's requested authorizations under section 7(c) of the NGA, and Parts 157 and 284 of the Commission's regulations, to construct and operate the Louisiana Connector and Texas Connector projects. These authorizations are subject to the conditions discussed herein.

I. Background

7. Port Arthur LNG, LLC, PALNG Common Facilities Company, LLC, and Port Arthur Pipeline, LLC are limited liability companies organized under the laws of the state of Delaware, and are wholly-owned subsidiaries of Port Arthur LNG Holdings, LLC, which is wholly-owned subsidiary of Sempra Global, which is a wholly-owned subsidiary of Sempra Energy. Upon the commencement of operations proposed in its

[6] 15 U.S.C. § 717f.

[7] 18 C.F.R. pt. 157.

[8] 18 C.F.R. pt. 284.

(continued ...)

application, Port Arthur Pipeline will become a natural gas company within the meaning of section 2(6) of the NGA,[9] and will be subject to the Commission's jurisdiction. As its operations will not be in interstate commerce, Port Arthur LNG will not be a "natural gas company" as defined in the NGA, although it will be subject to the Commission's jurisdiction under NGA section 3.

II. Proposals

A. Liquefaction Project (Docket No. CP17-20-000)

8. The Liquefaction Project would be located at the same site as Port Arthur LNG, L.P.'s proposed import terminal.[10] As proposed, the Liquefaction Project would consist of two liquefaction trains with a total production capacity of approximately 13.5 million metric tons per annum (MTPA) of LNG (each train capable of producing up to 6.73 MTPA). Port Arthur LNG also proposes to construct and operate feed gas treatment facilities; three LNG storage tanks, each with a net working capacity of approximately 160,000 cubic meters; a marine facility consisting of two berths for LNG vessels with a capacity of up to 266,000 cubic meters of LNG and capable of loading one LNG vessel per day; onsite, gas-turbine generators with a generating capacity of 240 megawatts; and appurtenant facilities.

9. Port Arthur LNG received authorization from the U.S. Department of Energy, Office of Fossil Energy (DOE/FE) in August, 2015, to export annually up to 517 billion cubic feet (Bcf) of natural gas in the form of LNG to countries with which the United States has a Free Trade Agreement (FTA), for a term of 25 years.[11] In addition, Port Arthur LNG currently has pending before the DOE/FE an application to export LNG to

[9] 15 U.S.C. § 717a(6) (2012).

[10] In 2006, the Commission, under section 3 of the NGA, authorized Port Arthur LNG, L.P. to site, construct, and operate an LNG import terminal near the City of Port Arthur, in Jefferson County, Texas. *Port Arthur LNG, L.P.* 115 FERC ¶ 61,344 (2006). In the same order, the Commission issued Port Arthur Pipeline, L.P. a certificate of public convenience and necessity pursuant to section 7(c) of the NGA and Part 157 of the Commission's regulations to construct and operate natural gas pipelines from the outlet of the proposed LNG terminal. Since neither applicant had begun construction of the authorized facilities within the time frame required, the Commission vacated the authorizations in September, 2011. *Port Arthur LNG, L.P. and Port Arthur Pipeline, L.P.,* 136 FERC ¶ 61,196 (2011).

[11] *Port Arthur LNG, LLC*, FE Docket No. 15-53-LNG, Order No. 3698 (Filed August 20, 2015).

(continued ...)

other nations with which the United States permits such trade, but has not entered into an FTA providing for the national treatment of trade in natural gas.[12]

B. Louisiana Connector and Texas Connector Projects (Docket No. CP18-7-000, and Docket Nos. CP17-21-000 & CP17-21-001)

10. Port Arthur Pipeline proposes to construct a new interstate natural gas pipeline system to transport up to a total of 4,000,000 MMBtu per day of natural gas to serve as feed gas for the Liquefaction Project. The Port Arthur Pipeline system would comprise two non-integrated pipelines: the Louisiana Connector Project and the Texas Connector Project.

1. Facilities

Louisiana Connector Project (Docket No. CP18-7-000)

11. The 130.9-mile-long Louisiana Connector Project would transport up to 2,000,000 MMBtu per day of natural gas from interconnections in Louisiana and Texas to the Liquefaction Project, where it would be liquefied for export to foreign markets. Specifically, the Louisiana Connector Project would consist of:

1. 130.9 miles of 42-inch-diameter pipeline extending from the Liquefaction Project north to interconnections with the facilities of:
    - Centana Intrastate Pipeline, LP;
    - Texas Eastern Transmission, LP;
    - Tennessee Gas Pipeline Company, L.L.C.;
    - Market Hub Partners Holding, LLC;
    - Pine Prairie Energy Center, LLC;
    - Texas Gas Transmission, LLC;
    - ANR Pipeline Company; and
    - Columbia Gulf Transmission, LLC;

[12] *See* application pending before DOE/FE in Docket No. 15-96-LNG (Filed June 15, 2015).

2. a new 89,900 horsepower (hp) compressor station consisting of four gas-driven turbines rated at 22,475 hp each located at milepost (MP) 96.2 in Allen Parish, Louisiana; and

3. appurtenant facilities, including pig launcher/receiver facilities located at MP 0, 63.4, 96.2, and 130.9.

12. The estimated cost of the Louisiana Connector Project facilities is approximately $1.2 billion.[13]

Texas Connector Project (CP17-21-000 and CP17-21-001)

13. The 34.2-mile-long Texas Connector Project would transport up to 2,000,000 MMBtu/d of natural gas from interconnections in Louisiana and Texas to the Liquefaction Project, where it would be liquefied for export to foreign markets. Specifically, the Texas Connector Project would consist of:

1. two segments of 42-inch-diameter pipe:

   - The 7.6-mile-long southern segment, extending from the Liquefaction Project south to interconnections with the facilities of the Natural Gas Pipeline Company of America and Kinder Morgan Louisiana Pipeline Company in Cameron Parish, Louisiana; and

   - The 26.6-mile-long northern segment extending from the Liquefaction Project north to interconnections with the facilities of Houston Pipeline Company, Texas Eastern Transmission, and Florida Gas Transmission Company, as well as underground storage facilities in Jefferson County, Texas;

2. approximately 4.65 miles of lateral pipeline of various diameters;

3. two new compressor stations, one each for the northern and southern segments. The northern compressor station, 50,052 hp total, would consist of three natural gas-driven turbine compressors rated at 16,684 hp each; the southern compressor station, 15,000 hp total, would consist of three electric-driven centrifugal compressors rated at 5,000 hp each; and

4. appurtenant facilities.

[13] Louisiana Connector Project Application, Exhibit K.

(continued ...)

The estimated cost of the Texas Connector Project is approximately $825.7 million.[14]

2. Open Season and Proposed Services

14. Port Arthur Pipeline states that it held a binding open season from August 21 through September 1, 2017, for service on the Louisiana Connector and Texas Connector projects. In response to the open season, Port Arthur Pipeline states that Port Arthur LNG entered into a 20-year precedent agreement for 100 percent of both the Louisiana Connector and Texas Connector projects' capacity at negotiated rates. Based upon this level of commitment, Port Arthur Pipeline provided Port Arthur LNG "Foundation Shipper" status, which provides certain benefits including the option to elect unilateral extensions of the contract term and a contractual right of first refusal.[15]

15. Port Arthur Pipeline requests approval of its *pro forma* tariff, as revised in its amended application in Docket No. CP 17-21-001. Port Arthur Pipeline proposes to provide firm and interruptible transportation service on the Louisiana Connector and Texas Connector projects under new Rate Schedules FT and IT, respectively. Port Arthur Pipeline also proposes to provide Enhanced Hourly Firm transportation service[16] under Rate Schedule EHFT, firm and interruptible storage service under Rate Schedules FSS and ISS, respectively, Parking and Lending service under Rate Schedule P&L, and load management service under rate schedule LMS. Port Arthur Pipeline also proposes a fuel retainage percentage for service on the Louisiana Connector and Texas Connector projects.

3. Blanket Certificates

16. Port Arthur Pipeline requests a blanket certificate of public convenience and necessity pursuant to Part 284, Subpart G of the Commission's regulations authorizing Port Arthur Pipeline to provide transportation service to customers requesting and

[14] Amendment Application, Exhibit K.

[15] *See* Port Arthur Pipeline's November 7, 2017 Amendment to the Texas Connector Project Application, at 12-13 (Amendment Application), Louisiana Connector Project Application at 33. Port Arthur Pipeline states that it is not requesting advance approval of any potentially non-conforming provisions in this certificate proceeding.

[16] "Enhanced Hourly Firm Transportation Service" enables a shipper to receive 1/21 of their daily scheduled quantity of gas per hour. *See* Amendment Application at 10.

(continued ...)

qualifying for transportation service under its proposed FERC Gas Tariff, with pre-granted abandonment authorization.[17]

17. Port Arthur Pipeline requests a blanket certificate of public convenience and necessity pursuant to Part 157, Subpart F of the Commission's regulations authorizing certain future facility construction, operation, and abandonment.[18]

III. Notice, Interventions, and Comments

18. Notice of Port Arthur LNG's application for the Liquefaction Project in Docket No. CP17-20-000, and Port Arthur Pipeline's application for the Texas Connector Project in Docket No. CP17-21-000, was published in the *Federal Register* on December 20, 2016, with comments, interventions, and protests due on January 3, 2017.[19] Notice of Port Arthur Pipeline's application for the Louisiana Connector Project in Docket No. CP18-7-000 was published in the *Federal Register* on November 3, 2017, with comments, interventions, and protests due on November 20, 2017.[20] Notice of Port Arthur Pipeline's amendment to the Texas Connector Project application in Docket No. CP17-21-001 was published in the *Federal Register* on December 6, 2017, with comments, interventions, and protests due on December 21, 2017.[21]

19. Golden Pass Products, LLC and Golden Pass Pipeline, LLC (collectively, Golden Pass) filed a timely motion to intervene in the Liquefaction Project, Louisiana Connector Project, and Texas Connector Project proceedings. Golden Pass received authorization to construct, own and operate an LNG export terminal located approximately two miles from the proposed Liquefaction Project, as well as an interstate natural gas pipeline system located in Calcasieu Parish, Louisiana, and Jefferson and Orange Counties, Texas.[22]

20. Driftwood Pipeline LLC and Driftwood LNG LLC (collectively, Driftwood) filed a timely motion to intervene in the Louisiana Connector proceeding. Concurrently with this order, Driftwood received authorization to construct an LNG export facility in

[17] 18 C.F.R. § 284.221 (2018).

[18] *Id.* § 157.204 (2018).

(continued ...)

Calcasieu Parish, Louisiana, as well as a 96-mile-long interstate natural gas pipeline system that would transport natural gas to Driftwood's proposed LNG terminal, certain segments of which will be collocated with the Louisiana Connector Project. [23]

21. Sabine Pass LNG, L.P., and Sabine Pass Liquefaction, LLC (collectively, Sabine Pass), and Cheniere Creole Trail Pipeline, L.P. (Creole Trail), filed a timely motion to intervene in the Liquefaction Project, Louisiana Connector Project, and Texas Connector Project proceedings. Sabine Pass owns and operates the existing Sabine Pass Liquefaction Terminal[24] located in Cameron Parish, Louisiana, and have an application pending before the Commission to add an additional liquefaction berth to their liquefaction terminal.[25] Creole Trail owns and operates the Creole Trail Pipeline,[26] an interstate pipeline system located in Beauregard and Cameron Parishes, Louisiana, designed to transport gas to the Sabine Pass Liquefaction Project.

22. In addition, a local landowner, Douglas Pedigo, filed a timely motion to intervene and comments in the Texas Connector Project proceeding, and the Coushatta Tribe of Louisiana (Coushatta Tribe) filed a timely motion to intervene in the Louisiana Connector Project proceeding. Timely, unopposed motions to intervene are automatically granted pursuant to Rule 214 of the Commission's Rules of Practice and Procedure.[27]

23. Several comments in support of the Liquefaction Project, Texas Connector Project, and Louisiana Connector Project were filed. The Coushatta Tribe of Louisiana commented on the potential of the Louisiana Connector Project to impact tribal lands.

IV. Discussion

A. Liquefaction Project (Docket No. CP17-20-000)

24. Because the proposed LNG terminal facilities will be used to export natural gas to foreign countries, the construction and operation of the proposed facilities and site of

[23] *Driftwood LNG, LLC*, 167 FERC ¶ 61,054 (2019).

[24] *Sabine Pass Liquefaction, LLC*, 139 FERC ¶ 61,039 (2012).

[25] For more information on Sabine Pass' proposal, *see* Sabine Pass' application filed in Docket No. CP19-11-000.

[26] *Cheniere Creole Trail Pipeline, L.P.*, 142 FERC ¶ 61,137 (2013), *reh'g denied Cheniere Creole Trail Pipeline, L.P.*, 145 FERC ¶ 61,074 (2013).

[27] 18 C.F.R. § 385.214 (2018).

(continued ...)

their location require approval by the Commission under section 3 of the NGA.[28] While section 3 provides that an application for the exportation or importation of natural gas shall be approved unless the proposal "will not be consistent with the public interest," section 3 also provides that an application may be approved "in whole or in part, with such modification and upon such terms and conditions as the Commission may find necessary or appropriate."[29] NGA section 3(a) also provides that for good cause shown, the Commission may make supplemental orders as it may find "necessary or appropriate."[30]

25. DOE/FE, pursuant to its authority under NGA section 3, has issued Port Arthur LNG authorization to export up to 1.91 billion cubic feet per day (Bcf/d), or approximately 10 million metric tons per annum (MTPA), of domestically-produced natural gas by vessel to all FTA nations from the proposed Liquefaction Project in Port Arthur, Texas, for a term of 25 years.[31] DOE/FE's initial order approving Port Arthur LNG's export volumes states that "[i]n light of DOE's statutory obligation to grant this Application without modification or delay, there is no need for DOE/FE to review other arguments asserted by Port Arthur LNG in support of the Application." [32]

---

[28] The regulatory functions of section 3 were transferred to the Secretary of Energy in 1977 pursuant to Section 301(b) of the Department of Energy Organization Act, Pub. L. No. 95-91, 42 U.S.C. § 7101 *et. seq.* In reference to regulating the imports or exports of natural gas, the Secretary subsequently delegated to the Commission the authority to approve or disapprove the construction and operation of natural gas import and export facilities and the site at which such facilities shall be located. The most recent delegation is in DOE Delegation Order No. 00-004.00A, effective May 16, 2006. Applications for authorization to import or export natural gas must be submitted to DOE. The Commission does not authorize importation or exportation of the commodity itself.

[29] For a discussion of the Commission's authority to condition its approvals of LNG facilities under section 3 of the NGA, *see, e.g., Distrigas Corporation v. FPC*, 495 F.2d 1057, 1063-64 (D.C. Cir. 1974), *cert. denied,* 419 U.S. 834 (1974), and *Dynegy LNG Production Terminal*, *L.P.*, 97 FERC ¶ 61,231 (2001).

[31] DOE/FE Order No. 3698-A at 4.

[32] DOE/FE Order No. 3698 at 5. Section 3(c) provides that the exportation and importation of natural gas to and from countries with which there is in effect a Free Trade Agreement "shall be deemed to be consistent with the public interest applications for

(continued ...)

26. We have reviewed Port Arthur LNG's application to determine if the siting, construction, and operation of its Liquefaction Project as proposed would not be consistent with the public interest.[33] The proposed Liquefaction Project is to be located entirely on lands owned by Port Arthur LNG. Further, the final Environmental Impact Statement (EIS) prepared for the proposed projects finds that most of the direct environmental impacts of the proposed facilities are expected to be minor.[34] All adverse impacts from construction and operation of the facilities will be reduced to less than significant levels if the projects are constructed and operated in accordance with applicable laws and regulation and the environmental mitigation measures recommended in the final EIS and adopted by this order.[35] The final EIS also concludes that reasonably foreseeable cumulative impacts from operation of the Liquefaction Project will not be significant.[36]

27. In accordance with the Memorandum of Understanding signed on August 31, 2018, by the Commission and PHMSA,[37] PHMSA undertook a review of the proposed facility's ability to comply with the federal safety standards contained in Part 193, Subpart B, of Title 49 of the Code of Federal Regulations. [38] On December 20, 2018, PHMSA issued a Letter of Determination (LOD) indicating Port Arthur LNG has demonstrated that the siting of its proposed LNG facilities comply with those federal safety standards. If the proposed Liquefaction Project is subsequently modified so that it

---

such importation and exportation shall be granted without modification or delay." 15 U.S.C. § 717b(c) (2012).

[33] *See National Steel Corp.,* 45 FERC ¶ 61,100, at 61,332-33 (1988) (observing that DOE, "pursuant to its exclusive jurisdiction, has approved the importation with respect to every aspect of it except the point of importation" and that the "Commission's authority in this matter is limited to consideration of the place of importation, which necessarily includes the technical and environmental aspects of any related facilities.").

[38] 49 C.F.R. pt. 193, Subpart B (2018).

(continued ...)

differs from the details provided in the documentation submitted to PHMSA, further review would be conducted by PHMSA.

28. Port Arthur LNG is proposing to operate its Liquefaction Project under the terms and conditions mutually agreed to by its customers and will solely bear the responsibility for the recovery of any costs associated with construction and operation of the project. Accordingly, Port Arthur LNG's proposal does not trigger NGA section 3(e)(4).[39]

29. In view of the above, we find that Port Arthur LNG's proposal is not inconsistent with the public interest. Therefore, we will grant Port Arthur LNG's application for authorization under section 3 of the NGA to site, construct, and operate its proposed LNG terminal facilities.

B. Pipeline Projects

30. Because the Louisiana Connector and Texas Connector projects' proposed pipeline facilities will be used to transport natural gas in interstate commerce subject to the jurisdiction of the Commission, the construction and operation of the facilities are subject to the requirements of subsections (c) and (e) of section 7 of the NGA.[40]

1. Application of the Certificate Policy Statement

31. The Certificate Policy Statement provides guidance for evaluating proposals to certificate new construction.[41] In the Certificate Policy Statement, the Commission established criteria for determining whether there is a need for a proposed project and whether the proposed project will serve the public interest. The Certificate Policy Statement explains that, in deciding whether to authorize the construction of major new natural gas facilities, the Commission balances the public benefits against the potential adverse consequences. The Commission's goal is to give appropriate consideration to the enhancement of competitive transportation alternatives, the possibility of overbuilding, subsidization by existing customers, the applicant's responsibility for unsubscribed capacity, the avoidance of unnecessary disruptions of the environment, and the unneeded exercise of eminent domain in evaluating new pipeline construction.

---

[39] 15 U.S.C. § 717b(e)(4) (2012) (governing orders for LNG terminals offering open access service).

[40] 15 U.S.C. §§ 717f(c) and 717f(e) (2012).

[41] *Certification of New Interstate Natural Gas Pipeline Facilities*, 88 FERC ¶ 61,227 (1999), *clarified*, 90 FERC ¶ 61,128, *further clarified*, 92 FERC ¶ 61,094 (2000) (Certificate Policy Statement).

32. Under this policy, the threshold requirement for pipelines proposing new projects is that the pipeline must be prepared to financially support the project without relying on subsidization from the existing customers. The next step is to determine whether the applicant has made efforts to eliminate or minimize any adverse effects the project might have on the applicant's existing customers, existing pipelines in the market and their captive customers, and landowners and communities affected by the route of a new pipeline. If residual adverse effects on these interest groups are identified after efforts have been made to minimize them, the Commission will evaluate the project by balancing the evidence of public benefits to be achieved against the residual adverse effects. This is essentially an economic test. Only when the benefits outweigh the adverse effects on economic interests will the Commission then proceed to consider the environmental analysis where other interests are addressed.

33. As noted above, the threshold requirement for pipelines proposing new interstate gas pipeline facilities is that the pipeline must be prepared to financially support the project without relying on subsidization from its existing customers. As Port Arthur Pipeline is a new company, it has no existing customers. As such, there is no potential for subsidization of the Louisiana Connector or Texas Connector projects' facilities by existing customers, or the degradation of service to existing customers as a result of the projects. Thus, we find that the Louisiana Connector and Texas Connector projects meet the threshold no-subsidy requirement of the Certificate Policy Statement.

34. The proposed Louisiana Connector and Texas Connector projects' facilities are designed to transport gas for liquefaction and export at Port Arthur LNG's Liquefaction Project. No other pipelines, or their captive customers have filed adverse comments regarding the Louisiana Connector or Texas Connector projects. Thus, we find that the Louisiana Connector and Texas Connector projects will not adversely affect other pipelines and their captive customers.

35. We also find that the Louisiana Connector and Texas Connector projects will have minimal adverse impacts on landowners and communities. Of the approximately 34.2 miles of pipeline that would be installed as part of the Texas Connector Project, nearly 53 percent, or 18.29 miles, is proposed to be co-located on existing pipeline right-of-way.[42] In addition, Port Arthur Pipeline states that approximately 95.6 miles, or 73 percent of the approximately 131 miles of pipeline that would be installed as part of Louisiana Connector projects, will be co-located along existing pipeline or electric transmission utility rights-of-way.[43]

---

[42] *See* Texas Connector Project Application, Resource Report 1, Table 1.1-4.

[43] *See* Louisiana Connector Project Application at 6.

36. In view of the considerations above, we find that Port Arthur Pipeline has demonstrated a need for the Louisiana Connector and Texas Connector projects, and that the benefits each project would provide outweigh their adverse effects on existing customers, other pipelines and their captive customers, landowners, and surrounding communities. Therefore, we find, consistent with the criteria discussed in the Certificate Policy Statement and subject to the environmental discussion below, that the public convenience and necessity requires approval of Louisiana Connector and Texas Connector projects, as conditioned in this order.

2. Blanket Certificates

37. Port Arthur Pipeline requests a Part 284, Subpart G blanket certificate in order to provide open-access transportation services. Under a Part 284 blanket certificate, Port Arthur Pipeline will not require individual authorizations to provide transportation services to particular customers. Port Arthur Pipeline filed a *pro forma* Part 284 tariff to provide open-access transportation services. Since a Part 284 blanket certificate is required for Port Arthur Pipeline to participate in the Commission's open-access regulatory regime, we will grant Port Arthur Pipeline a Part 284 blanket certificate, subject to the conditions imposed herein.

38. Port Arthur Pipeline has also applied for a Part 157, Subpart F blanket certificate. The Part 157 blanket certificate gives an interstate pipeline NGA section 7 authority to automatically, or after prior notice, perform a restricted number of routine activities related to the construction, acquisition, abandonment, and replacement and operation of existing pipeline facilities provided the activities comply with constraints on costs and environmental impacts.[44] Because the Commission has previously determined through a rulemaking that these blanket-certificate eligible activities are in the public convenience and necessity,[45] it is the Commission's practice to grant new natural gas companies a Part 157 blanket certificate if requested.[46] Accordingly, we will issue Port Arthur Pipeline the requested blanket construction certificate under Part 157 of the Commission's regulations, subject to the conditions imposed herein.

---

[46] *C.f. Rover Pipeline LLC,* 161 FERC ¶ 61,244, at P 13 (2017) (denying a request for a blanket certificate where the company's actions had eroded the Commission's confidence it would comply with all the requirements of the blanket certificate program, including the environmental requirements.).

(continued ...)

3. Rates

a. Initial Recourse Rates

39. Port Arthur Pipeline proposes to establish separate zone rates for the Louisiana Connector and Texas Connector facilities because of the non-integrated nature of the two pipeline systems. Port Arthur Pipeline estimates that the total capital cost of construction for the Louisiana Connector and Texas Connector projects' facilities will be $825,683,539[47] and $1,207,584,005,[48] respectively. Port Arthur Pipeline initially proposed a $146,140,823 cost of service for the Texas Connector Project and a $206,800,419 cost of service for the Louisiana Connector Project, utilizing a capital structure of 60 percent debt and 40 percent equity, a cost of debt of 5.7 percent, a return on equity of 14.00 percent, a federal tax rate of 35 percent, and a depreciation rate of 2.00 percent.[49]

40. In a February 6, 2018 response to a staff data request, (February 6 Data Response) Port Arthur Pipeline provided adjusted costs of service and recalculated its initial incremental recourse rates to reflect changes in the federal tax code, as per the Tax Cuts and Jobs Act of 2017,[50] which became effective January 2018. Due to the changes to the federal tax code, the cost of service for the Texas Connector Project was reduced to $135,042,816, and the cost of service for the Louisiana Connector Project was reduced to $188,555,221, with correspondingly lower calculated initial charges for firm and interruptible services.[51] As Port Arthur Pipeline's calculations in its February 6 Data Response reflect the federal tax code that will be in effect when the project goes into service, the Commission will use the revised costs of service for the purpose of establishing the initial recourse rates, to the extent Port Arthur Pipeline demonstrates that it is entitled to an income tax allowance, as further discussed below.

41. For the Texas Connector Project, Port Arthur Pipeline proposes an initial maximum monthly recourse reservation charge of $5.7059 per Dth, and an initial usage

[49] Amendment Application, Exhibits O and P; Louisiana Connector Application, Exhibits O and P.

[50] Pub. L. No. 115-97, 131 Stat. 2054 (Dec. 22, 2017).

[51] *See* Exhibit P, Part I of Port Arthur Pipeline's Data Response.

(continued ...)

charge of $0.0033 per Dth, for firm transportation service under Rate Schedule FT.[52] Port Arthur Pipeline developed its proposed FT reservation charge using first-year fixed costs of $133,519,072, and annual reservation billing determinants of 23,400,000 Dth.[53] Port Arthur Pipeline states that its proposed usage charge reflects variable costs of $1,523,744 and billing determinants of 467,200,000 Dth, based on an 80 percent load factor of the Texas Connector Project's annual design throughput. Although Port Arthur Pipeline states that the billing determinants are based on an 80 percent load factor of the Texas Connector Project's annual design throughput (daily design capacity of 2,000,000 Dth, times 365, times 80 percent), Port Arthur Pipeline's proposed billing determinants do not equal a load factor of 80 percent, but instead approximately 64 percent.[54]

42. For the Louisiana Connector Project, Port Arthur Pipeline proposes an initial maximum monthly recourse reservation charge of $7.8244 per Dth, and an initial usage charge of $0.0013 per Dth for firm transportation service under Rate Schedule FT.[55] Port Arthur Pipeline developed its proposed FT reservation charge for the Louisiana Connector Project using first-year fixed costs of $187,710,599, and annual reservation billing determinants of 23,990,400 Dth.[56] The proposed usage charge reflects variable costs of $844,622 and billing determinants of 656,737,200 Dth, based on a 90 percent load factor of the Louisiana Connector Project's annual design throughput.[57]

43. Under Rate Schedule EHTF, Port Arthur Pipeline proposes an initial monthly reservation charge of $6.5210 per Dth for service on the Texas Connector Project facilities and a monthly reservation charge of $8.9422 per Dth for service on the Louisiana Connector Project facilities.[58] As noted above, Rate Schedule EHFT provides a shipper the right to take its daily scheduled quantity ratably over a 21-hour period rather

---

[52] *Id.*

[53] *Id.* Port Arthur did not use the daily design capacity of the Texas Connector Project (2,000,000 Dth) in calculating the proposed reservation charge. Instead, its calculation is based on 23,400,000 Dth in annual billing determinants, which is approximately 97.5 percent of the project's 24,000,000 Dth annualized design capacity. *See* Amended Exhibit P, Part 1, Page 2.

[54] *Id.*

[55] *See* Exhibit P, Part I, Page 1 of Port Arthur Pipeline's Data Response.

[56] *Id.,* Page 2.

[57] *Id.*

[58] *Id.*

than a 24-hour period. Port Arthur Pipeline does not anticipate having any initial customers under Rate Schedule EHFT and does not allocate costs to the service. Instead, Port Arthur Pipeline applies the factor of 1.1429 (24 divided by 21) to each zone FT rate to calculate a rate that accounts for the costs related to the additional capacity needed to provide service under Rate Schedule EHFT.

44. Port Arthur Pipeline also proposes rates for Interruptible Transportation (IT) service, Parking and Lending (P&L) service, and Authorized Overrun Service (AOS), derived from a 100 percent load factor rate of the respective zone's FT reservation and usage charges.

45. While the Commission generally finds Port Arthur Pipeline's proposed cost of service and initial rates for the Louisiana Connector and Texas Connector projects acceptable, the Commission will require Port Arthur Pipeline to recalculate its rates based on revised billing determinants for its reservation charges. After reviewing Port Arthur Pipeline's workpapers, the Commission finds that Port Arthur Pipeline has not based its billing determinants on 100 percent of the design capacity of the pipelines. The Commission has a long-standing policy of basing initial rates on the design-capacity of the pipeline.[59] This approach ensures that a pipeline constructing facilities is placed at risk for underutilization of the facilities if it does not contract with customers for the full capacity of the pipeline.[60] Port Arthur Pipeline states that the design capacities for the Louisiana Connector and Texas Connector projects are each 2,000,000 MMBtu, and thus Port Arthur Pipeline is directed to design its reservation charges based on this capacity. In addition, Port Arthur Pipeline is directed to clarify the billing determinants used to establish the usage charges for the Louisiana Connector and Texas Connector projects. Subject to the discussion herein, the Commission finds Port Arthur Pipeline's proposed costs of service and initial rates for the Louisiana Connector and Texas Connector projects reasonable.

4. Federal Income Tax Allowance

46. Consistent with the D.C. Circuit's holding in *United Airlines*, *Inc. v FERC*,[61] the Commission has held that a double recovery of income tax costs results from granting a Master Limited Partnership (MLP) a separate income tax allowance and a pre-tax return

[59] *Ruby Pipeline, L.L.C.*, 128 FERC ¶ 61,224 (2009), *order on reh'g* 131 FERC ¶ 61,007 (2010).

[60] *See Cameron Interstate Pipeline, LLC,* 160 FERC ¶ 61,009, at P 11 (2017).

[61] 827 F.3d 122, 134, 136 (D.C. Cir. 2016) (*United Airlines*).

(continued ...)

on equity.[62] Accordingly, the Commission has established a policy that MLPs are generally not permitted to recover an income tax allowance in their cost of service. For those pass-through business forms that are not MLPs, the Commission continues to consider how to resolve the double recovery concern raised by *United Airlines*.[63] However, the Commission has clarified that a natural gas company organized as a pass-through entity, all of whose income or losses are consolidated on the federal income tax return of its corporate parent, is considered to be subject to the federal corporate income tax, and is thus eligible for a tax allowance.[64] For all other pass-through entities claiming an income tax allowance, parties should fully address the double-recovery concern raised by the court in *United Airlines*,[65] including the pass-through entities' ownership structure, where any income tax liability is incurred in that ownership structure, and whether those income tax liabilities are reflected in the return on equity.

---

[62] *SFPP, L.P.*, Opinion No. 511-C, 162 FERC ¶ 61,228, at PP 21-30 (2018); *Enable Mississippi River Transmission, LLC*, 164 FERC ¶ 61,075, at PP 34-35 (2018) (*Enable*); *see also Inquiry Regarding the Commission's Policy for Recovery of Income Tax Costs*, 162 FERC ¶ 61,227 (Revised Policy Statement) (providing guidance that an MLP may not recover an income tax allowance), *order on reh'g*, 164 FERC ¶ 61,030 (2018)).

[63] Revised Policy Statement, 162 FERC ¶ 61,227 at PP 3, 45; *Trailblazer Pipeline Co., LLC*, 164 FERC ¶ 61,074, at PP 30-31 (2018) (*Trailblazer*).

[64] *See Enable*, 164 FERC ¶ 61,075 at PP 34-35; *BP West Coast Products, LLC v. FERC*, 374 F.3d 1263, at 1289 (D.C. Cir. 2004) (disallowing an income tax allowance for an MLP's corporate unitholders, while explaining that an income tax allowance is appropriate in the cost of service of a pass-through subsidiary of a corporation "when such a subsidiary does not itself incur a tax liability but generates one that might appear on a consolidated return of the corporate group."). *See also Interstate and Intrastate Natural Gas Pipelines; Rate Changes Relating to Federal Income Tax Rate*, Order No. 849, 164 FERC ¶ 61,031 at P 3 (2018) (clarifying that for purposes of the FERC Form No. 501-G and limited section 4 filings contemplated by the final rule "a natural gas company organized as a pass-through entity all of whose income or losses are consolidated on the federal income tax return of its corporate parent is considered to be subject to the federal corporate income tax, and is thus eligible for a tax allowance.").

[65] Revised Policy Statement, 162 FERC ¶ 61,227 at PP 3, 45; *Trailblazer*, 164 FERC ¶ 61,074 at P 31.

47. Here, Port Arthur Pipeline represents that it is a wholly-owned subsidiary of Sempra Energy, effective November 29, 2016.[66] To the extent that Port Arthur Pipeline can demonstrate in its compliance filing to place its initial rates in-service that all of its income or losses are consolidated on the federal income tax return of its corporate parent, then Port Arthur Pipeline is permitted an income tax allowance on a stand-alone basis.[67] Consistent with the discussion above, if Port Arthur Pipeline cannot make such a showing, then Port Arthur Pipeline must provide other evidence to address the double-recovery concern raised by the court in *United Airlines*.[68] To the extent Port Arthur Pipeline does not make such a demonstration, the tariff records it files setting forth the initial rates for service must reflect rates recalculated to reflect removal of the proposed tax allowance and accumulated deferred income tax from its cost of service. If Port Arthur Pipeline fails to remove the proposed income tax allowance and accumulated deferred income taxes from the initial rates, the filing will be rejected as not being in compliance with this order and Port Arthur Pipeline will have to refile those records with the appropriate rates and receive Commission approval prior to going into service.

5. Allowance for Funds Used During Construction

48. Port Arthur Pipeline, a new pipeline company, proposes to calculate its Allowance for Funds Used During Construction (AFUDC) based on its proposed debt and equity capital structure. This approach is consistent with the accounting guidance we have given other newly created companies.[69] Consistent with Commission precedent, Port Arthur Pipeline is required to capitalize the actual costs of borrowed and other funds used for construction purposes, not to exceed the amount of debt and equity AFUDC that would be capitalized based on the overall rate of return approved. This will ensure that the amounts included in AFUDC are properly capitalized in this project, consistent with the Commission's requirements for newly created companies approved in other cases.

---

(continued ...)

6. Fuel Rates

49. Port Arthur Pipeline is proposing an in-kind system fuel retention percentage with an annual tracker mechanism. Port Arthur Pipeline states that it will make an annual filing to true up any differences between (i) the quantity of gas retained through the fuel retention charge, and (ii) actual fuel consumed and volumes of gas lost and unaccounted for (LAUF) on its system. Port Arthur Pipeline proposes an initial fuel percentage of 0.98 percent for the Texas Connector Project[70] and 1.2 percent for the Louisiana Connector Project.[71] These percentages are designed to recover actual quantities used in compression, as well as LAUF volumes for each project or rate zone. The Commission accepts Port Arthur Pipeline's proposed initial fuel retainage percentages. The proposed annual tracker mechanism is addressed below.

7. Service under Rate Schedules FSS, ISS, and LMS

50. Port Arthur Pipeline does not propose to construct storage capacity as part of its system, but states that it will interconnect with off-system underground natural gas storage facilities. Port Arthur Pipeline's certificate application includes service proposals that would require the use of off-system storage capacity for firm storage service under Rate Schedule FSS, interruptible storage service under Rate Schedule ISS, and a load management service under Rate Schedule LMS. Moreover, section 13.43 of Port Arthur Pipeline's *pro forma* General Terms and Conditions (GT&C) (Off System Capacity) would permit Port Arthur Pipeline to acquire, through transportation agreements, off-system capacity rights, for operational reasons or to render service for its shippers within a zone, under its approved tariff and rates. Section 13.43 of the GT&C states that when off-system capacity is not required for operational reasons or to meet firm service commitments, Port Arthur Pipeline will offer the off-system capacity to shippers on a primary firm basis within the zone. Finally, section 13.43 of the GT&C states that Port Arthur Pipeline is not precluded from seeking case specific authorization for the utilization of off-system capacity by Port Arthur Pipeline for other purposes, nor does it preclude Port Arthur Pipeline from releasing any capacity it holds on off-system pipeline companies.

51. Port Arthur Pipeline has not proposed rates for Rate Schedules FSS and ISS. Port Arthur Pipeline asserts that its proposed LMS maximum monthly "reservation" rate of

[70] Texas Connector Project Application at 21.

[71] Louisiana Connector Project Application at 22.

$1.50 per Dth is the maximum it believes it can charge in the market area, and is lower than its proposed Rate Schedule P&L monthly "reservation" rate of $0.2065 per Dth.[72]

52. Port Arthur Pipeline has not developed rates for FSS and ISS services, and its maximum monthly market-based "reservation" rate for LMS service is unsupported. Thus, we reject Port Arthur Pipeline's proposed Rate Schedules FSS, ISS, and LMS and direct Port Arthur Pipeline to delete these rate schedules and any references thereto from its tariff.

53. Moreover, we note that the Commission's regulations set forth requirements for cost pass-through mechanisms.[73] Port Arthur Pipeline has not proposed a tariff-based cost recovery mechanism that would meet the requirements of section 154.403 of the Commission's regulations for passing through off-system costs to its customers. This rejection is without prejudice to Port Arthur Pipeline filing a rate and tariff proposal for Rate Schedule FSS, ISS and LMS services that is consistent with Commission precedent and regulations. The filing should include a detailed narrative explanation of how Port Arthur Pipeline intends to recover cost-based rates associated with its use of off-system capacity, as well as workpapers in Excel format showing all formulas underlying its rate derivations. Moreover, if Port Arthur Pipeline seeks to pass through to its customers' market-based rates charged by off-system storage providers, it must provide a study showing that it is not able to exercise market power.

8. Pipeline Safety and Greenhouse Gas Costs

54. Port Arthur Pipeline proposes tracking mechanisms for cost increases due to any new pipeline safety or greenhouse gas regulations issued after Port Arthur Pipeline's initial rates are approved. Section 13.29.3 of the GT&C states that Port Arthur Pipeline shall file annually to revise a Transmission Pipeline Safety Costs and Greenhouse Gas Costs Surcharge for each zone on or before September 30 to become effective November 1.

55. Port Arthur Pipeline's proposed Transmission Pipeline Safety Costs and Greenhouse Gas Costs Surcharge closely resembles modernization trackers that the Commission addressed in its policy statement *Cost Recovery Mechanisms for Modernization of Natural Gas Facilities*.[74] In the Cost Recovery Policy Statement, the

---

[72] *See* Texas Connector Project Application at 21; Louisiana Connector Project Application at 22.

[73] 18 C.F.R. § 154.403 (2018).

[74] 151 FERC ¶ 61,047, *clarification denied*, 152 FERC ¶ 61,046 (2015) (*Cost Recovery Policy Statement)*.

Commission adopted five guiding principles as the standards a pipeline would need to satisfy for the Commission to approve a surcharge such as the one proposed by Port Arthur:

1. the pipeline's existing rates must have been reviewed through an NGA general section 4 rate proceeding, a cost and revenue study, or through a collaborative effort between the pipeline and its customers;

2. the costs eligible for recovery through the surcharge must generally be limited to one-time capital costs incurred to modify the pipeline's existing system to comply with safety or environmental regulations or other federal or state government agencies, or costs shown to be necessary for safe, reliable, and/or efficient operation of the pipeline;

3. the pipeline must design any proposed surcharge in a manner that will protect the pipeline's captive customers from cost shifts due to the surcharge;

4. the pipeline must include some method to allow a periodic review of whether the surcharge and the pipeline's base rates remain just and reasonable; and

5. the pipeline must work collaboratively with shippers to seek shipper support for any surcharge proposal.[75]

56. Port Arthur Pipeline has not demonstrated that its proposal meets the standards laid out in the Cost Recovery Policy Statement. Port Arthur Pipeline's proposal does not offer support for the surcharge from shippers, nor does it offer a method to allow for a periodic review of whether the surcharge and the pipeline's base rates remain just and reasonable. Furthermore, the Commission finds it is speculative to anticipate what types of costs Port Arthur Pipeline may be subject to under federal, state or local legislation, whether such costs should be recoverable, and, if recoverable, the manner in which they should be recovered. This action is without prejudice to Port Arthur Pipeline filing a proposal in the future if it actually incurs such costs or in compliance with the Cost Recovery Policy Statement.[76] Consistent with this determination, Port Arthur Pipeline is directed to delete references to the Transmission Pipeline Safety Costs and Greenhouse Gas Costs Surcharge from its tariff.

[75] Cost Recovery Policy Statement, 151 FERC ¶ 61,047 at P 31.

[76] *Sierrita Gas Pipeline, LLC,* 147 FERC ¶ 61,192, at P 48 (2014).

(continued ...)

9. Three Year Filing Requirement

57. Consistent with Commission precedent, Port Arthur Pipeline is required to file a cost and revenue study no later than three months after its first three years of actual operation to justify its existing cost-based firm and interruptible recourse rates.[77] In this filing, the projected units of service should be no lower than those upon which Port Arthur Pipeline's approved initial rates are based. The filing must include a cost and revenue study in the form specified in section 154.313 of the Commission's regulations to update cost of service data.[78] Port Arthur Pipeline's cost and revenue study should be filed through the eTariff portal using a Type of Filing Code 580. In addition, Port Arthur Pipeline is advised to include as part of the eFiling description, a reference to Docket Nos. CP17-21-000, CP17-21-001, and CP18-7-000 and the cost and revenue study.[79] After reviewing the data, the Commission will determine whether to exercise its authority under NGA section 5 to investigate whether the rates remain just and reasonable. In the alternative, in lieu of this filing, Port Arthur Pipeline may make an NGA general section 4 rate filing to propose alternative rates to be effective no later than three years after the in-service date for its proposed facilities.

10. Negotiated Rate Requirements

58. Port Arthur Pipeline proposes to provide service on the Louisiana Connector and Texas Connector projects to the project shipper under negotiated rate agreements. Port Arthur Pipeline must file either its negotiated rate agreement or tariff records setting forth the essential terms of the agreements in accordance with the Commission's Alternative Rate Policy Statement[80] and negotiated rate policies.[81] Port Arthur Pipeline must file the

---

(continued ...)

negotiated rate agreements or tariff records at least 30 days, but not more than 60 days, before the proposed effective date for such rates.[82]

11. Pro Forma Rate Updates

59. Port Arthur Pipeline requests waiver of any Commission regulations necessary to allow it to revise its proposed rates prior to the in-service date of the project to reflect actual cost information.[83] Port Arthur Pipeline's request for a waiver is denied.

60. However, Port Arthur Pipeline may propose to modify its initial rates to reflect updated cost and rate information by filing an amendment to this certificate proceeding, but any changes to initial rates can only take place prior to the project being placed into service. Thus, Port Arthur Pipeline should file any such amendment application, complete with all necessary supporting information, no later than 60 days prior to its anticipated in-service date to afford the Commission time to review and act upon its request. If Port Arthur Pipeline chooses to place its project into service before the Commission has acted on any amendment request, it will have to file an NGA section 4[84] rate case in order to change the rates approved in this order.

12. Pro Forma Tariff

a. Reservation of Capacity for Future Expansions

61. Section 13.4.1 of the GT&C (Open Season for Generally Available Capacity) provides in part:

> (a) Pipeline will allocate firm pipeline capacity in accordance with this Section 13.4. To the extent Pipeline has available unsubscribed capacity for which there are no pending requests, Pipeline reserves the right, but shall not be obligated, to reserve such capacity for open seasons to be held

---

114 FERC ¶ 61,042, *reh'g dismissed and clarification denied,* 114 FERC ¶ 61,304 (2006).

[82] Pipelines are required to file any service agreement containing non-conforming provisions and to disclose and identify any transportation term or agreement in a precedent agreement that survives the execution of the service agreement. 18 C.F.R. § 154.112(b) (2018).

[83] Louisiana Connector Application at 36.

[84] 15 U.S.C. § 717c(d) (2012).

(continued ...)

> within the next six (6) Months for the purpose of limiting or avoiding a future expansion.

62. This paragraph is the only reference in Port Arthur Pipeline's tariff to reserving capacity for future expansions. While the Commission permits such reservations of capacity, Commission policy requires the tariff include several conditions to ensure that "reserved capacity is offered in a not unduly discriminatory manner." [85] As laid out in greater detail in *Iroquois Gas Transmission System,* these conditions require Port Arthur Pipeline to:

1. post all available capacity so that all shippers may bid on it;
2. delineate that all capacity may only be reserved for a one-year period from the date posted;
3. provide detailed information in the posting of the reserved capacity;
4. solicit turnback capacity as a part of the process, to assist parties in determining the correct size of any expansion project; and
5. include solicitation procedures to ensure that excess and turnback capacity is posted.

Port Arthur Pipeline is directed to revise its tariff to include such provisions, consistent with Commission precedent.[86]

b. <u>Right of First Refusal and Net Present Value Standard</u>

63. Section of the 13.4.3 of the GT&C (Net Present Value Standard) provides in part that Port Arthur Pipeline shall award capacity for bids received during an open season to shippers whose bids it has determined to have the highest net present value (NPV). Section of the 13.4.3 of the GT&C describes NPV as

> the discounted cash flow of incremental revenues per dekatherm to Pipeline produced, lost or affected by the requests for service and shall be based upon such factors as the term, quantity, date on which the requested service is requested to commence, *and other factors determined to be relevant by Pipeline*. (Emphasis added.)

---

[85] *See, e.g., Iroquois Gas Transmission System*, 100 FERC ¶ 61,279 (2002).

[86] *Id.* PP 5-10.

64. With respect to bids for capacity subject to a right of first refusal, section 13.4.2(c) of the GT&C provides:

> If Pipeline is willing to accept a bid, Pipeline shall, no later than fifteen (15) Days after the close of the bidding period, notify Shipper of the bid having the highest Net Present Value ("NPV"). Shipper shall have ten (10) Days after receiving notice to notify Pipeline as to whether it will match the bid having the highest NPV *and longest term*. If the Shipper elects to exercise its Right of First Refusal to match the bid with the highest NPV it must execute a new Service Agreement containing the terms of that bid, which new Service Agreement shall succeed the prior agreement following its expiration; provided, however, that Shipper shall not be required to pay any rate higher than the maximum applicable rate. (Emphasis added.)

65. The emphasized language in section 13.4.2(c) of the GT&C is not consistent with the Commission's policy that, in the context of the right of first refusal (ROFR) bidding process, "shippers may bid whichever combination of rate and term best represents the value they place on the capacity."[87] The Commission further finds that the phrase "and other factors determined to be relevant by Pipeline" in section 13.4.3 of the GT&C is overbroad and lacks clarity regarding how the NPV should be calculated. Accordingly, Port Arthur Pipeline is directed to delete the phrases "and the longest term" from section 13.4.2(c) of the GT&C and "and other factors determined to be relevant by the pipeline" from section 13.4.3 of the GT&C.

c. ROFR Notification

66. The Commission has held that both a shipper and the pipeline have the right to initiate the ROFR process through issuance of a notification to one another.[88] However, section 13.4.2 of the GT&C expressly grants this right only to the pipeline, stating in part, "if Pipeline provides written notice to Shipper to terminate any Long Term Service Agreement for firm transportation at the maximum tariff rate, Shipper will have a right of first refusal to retain such firm capacity by complying with the bidding procedures in this Section 13.4." Port Arthur Pipeline is directed to revise section 13.4.2 of the GT&C to be consistent with the Commission's ROFR notification policy.

---

[87] *Atlantic Coast Pipeline, LLC*, 161 FERC ¶ 61,042, at P 156 (2017) (citing *Transcontinental Gas Pipe Line Corp.,* 105 FERC ¶ 61,365, at P 20 (2003)).

[88] *Texas Eastern Transmission, LP*, 102 FERC ¶ 61,262, at PP 26-28 (2003).

(continued ...)

d. ROFR Bid Matching

67. Under the Commission's policy, a ROFR shipper is permitted to match the best third-party bid for all or only a volumetric portion of the open season capacity.[89] However, section 13.4.2(c) of the GT&C provides, in part:

> If the Shipper elects to exercise its Right of First Refusal to match the bid with the highest NPV it must execute a new Service Agreement *containing the terms of that bid*, which new Service Agreement shall succeed the prior agreement following its expiration ….(Emphasis added.)

68. The emphasized language could be interpreted as inconsistent with the shipper's right to match bids for only a portion of its expiring capacity, and that the ROFR shipper does not have a right of contract reduction. Therefore, Port Arthur Pipeline is directed to clarify section 13.4.2 of the GT&C to provide that a shipper may notify Port Arthur Pipeline of its intent to match the best offer(s) for all or a volumetric portion of its capacity.

e. Posting ROFR Capacity

69. Section 13.4.2(a) of the GT&C provides that Port Arthur Pipeline "shall post the capacity [subject to ROFR rights] for bidding on its Internet Web Site no later than one-hundred and eighty (180) Days prior to the expiration of the current Service Agreement." The phrase "no later than" implies that Port Arthur Pipeline and a shipper may negotiate a deadline by which the ROFR notice must be provided under section 13.4.2(a) of the GT&C. While the Commission has permitted the negotiation of the ROFR notice deadline, the Commission also requires a stated outer limit on how far in advance of the end of the contract the ROFR process may begin.[90] This outer limit permits the ROFR process to take place relatively close to the time the contract terminates so that existing shippers, as well as prospective shippers, are provided a timely opportunity to assess the value of capacity.[91] It is unclear whether the phrase "no later than" is intended to authorize negotiation of the ROFR notice deadline, which must be implemented on a not unduly discriminatory basis, and/or whether it is intended to function as a "not earlier

---

[89] *Mountain Valley Pipeline, LLC,* 161 FERC ¶ 61,043, at P 113 (2017); *see also Dominion Trans., Inc.* 111 FERC ¶ 61,135, at PP 18-22 (2005).

[90] *Gulf South Pipeline Company, LP*, 115 FERC ¶ 61,301, at PP 11-13 (2006).

[91] *Id.*

than" outer limit on the ROFR prior notice.[92] Port Arthur Pipeline is required to clarify and support its proposed notice date consistent with this discussion and Commission precedent.[93]

f. Operational Balancing Agreements

70. Section 13.7.1 of the GT&C (Operational Balancing Agreements) provides in relevant part that "[p]ipeline may enter into [Operational Balancing Agreements (OBAs)] with interstate, intrastate pipelines, or LNG terminals that operate natural gas facilities that directly interconnect with Pipeline's system (hereinafter called "OBA Party")," and lists five conditions under which Port Arthur Pipeline would have no obligation to negotiate and execute OBAs with any OBA Party.

71. North American Energy Standards Board (NAESB) Wholesale Gas Quadrant (WGQ) Version 3.0 Flowing Gas Related Standard 2.3.29 provides that "[a]t a minimum, [pipeline] should enter into [OBAs] at all pipeline-to-pipeline (interstate and intrastate) interconnects." Further, the Commission's regulations provide that "[a] pipeline must enter into [OBAs] at all points of interconnection between its system and the system of another interstate or intrastate pipeline."[94] Accordingly, Port Arthur Pipeline is directed to revise its tariff to comply with NAESB WGQ Version 3.0 Flowing Gas Related Standard 2.3.29 and section 284.12(b)(2)(i) of the Commission's regulations, and delete the above-mentioned conditions under which Port Arthur Pipeline would not be obligated to negotiate and execute OBAs with any OBA Party.

72. Section 13.7.1(a) of the GT&C states in part:

> For the purpose of minimizing operational conflicts between various pipeline facilities with respect to the delivery of gas to and from Pipeline's facilities, *Pipeline may enter* into OBAs with interstate, intrastate pipelines, or LNG terminals that operate natural gas facilities that directly interconnect with Pipeline's system (herein called ""OBA Party""). (Emphasis added.)

---

[92] *E.g.,* Panhandle Eastern Pipe Line Company, LP, FERC NGA Gas Tariff, Fourth Revised Vol. No. 1, GT&C Section 7, Contracting for Service Rights, 1.0.0 provides that, for contracts two years or longer, notice must be provided "[n]ot earlier than 18 Months and not later than 12 Months."

[93] *See, e.g., Rover Pipeline LLC*, 158 FERC ¶ 61,109, at P 135 (2017) (*Rover*).

[94] 18 C.F.R. § 284.12(b)(2)(i) (2018).

(continued ...)

73. Port Arthur Pipeline is directed to revise its tariff to conform with Commission policy and NAESB WGQ Standard 2.3.29 which requires "[a]t at minimum…" pipelines to "enter into Operational Balancing Agreements at all pipeline-to-pipeline (interstate and intrastate) interconnects."[95]

g. Multiple Penalties for the Same Infraction

74. Sections 13.7.9 (Scheduling Penalties) and 13.10.4(b) (Curtailment and Penalties) of the GT&C allow penalties to be assessed in addition to any other applicable charges and penalties. Commission policy prohibits multiple penalties from being assessed for the same infraction.[96] Therefore, these sections should be revised to be consistent with Commission Policy. We also direct Port Arthur Pipeline to revise paragraph 5.2.4 of Rate Schedule FT quoted below to ensure that a shipper is not assessed both an operational flow order (OFO) penalty and an Excess Hourly Take Penalty for the same action:

> Quantities taken on behalf of Shipper at the Delivery Point(s) in any hour in excess of 1/24 of the Shipper's daily scheduled quantities shall be subject to the Excess Hourly Take Penalty applicable to excess hourly takes when either no OFO is in effect at the Delivery Points(s) or such an OFO is in effect.

h. Interconnecting Operator OFOs

75. Section 13.9.1 of the GT&C states in part:

> Pipeline reserves and will have the right to issue Operational Flow Orders to preserve the integrity of Pipeline's system, to prevent or respond to a force majeure event, to ensure adequate operating pressures, to have adequate supplies in the system, to assure adequate fuel and Fuel Retainage, to maintain firm services and to stabilize the operation of the system.

76. The above-quoted language in section 13.9.1 of the GT&C is consistent with the Commission's policy that an OFO can be issued only in situations which "threaten or could threaten the safe operations or system integrity, of the transportation service provider's system or to maintain operations required to provide efficient and reliable firm

---

[95] *Rover,* 158 FERC ¶ 61,109 at P 130.

[96] *Id.* P 129; *Columbia Gas Transmission Corp.*, 100 FERC ¶ 61,084, at P 201 (2002).

(continued ...)

service."[97] Section 13.9.4 of the GT&C states that Port Arthur Pipeline may issue an OFO if a directly interconnected operator issues an OFO. This language could allow Port Arthur Pipeline to bypass the need to assess whether conditions on its own system as set forth in section 13.9.1 of the GT&C of its tariff support issuance of an OFO. Port Arthur Pipeline is directed to delete section 13.9.4 of the GT&C from its tariff.

i. Curtailment and Force Majeure

77. Section 13.10.1 of the GT&C provides in part:

> Pipeline shall have the right to curtail transportation services, in whole or in part, on all or a portion of its system in an emergency situation, as determined by Pipeline in its sole judgment, or when an unexpected capacity loss occurs after Pipeline has scheduled service and Pipeline is therefore unable to perform the service that it has scheduled… . In addition, Pipeline shall have the right to interrupt or discontinue service at any time for reasons of Force Majeure *or when, in Pipeline's sole judgment, capacity or operating conditions so require or it is desirable or necessary to make modifications or operating changes to its system.* (Emphasis added.)

78. The Commission has found that pipelines may only "curtail" scheduled service in an emergency situation or when an unexpected capacity loss occurs after the pipeline has scheduled service, and the pipeline is therefore unable to perform the service which it has scheduled.[98] As quoted above, section 13.10.1 of the GT&C gives Port Arthur Pipeline the right to curtail services under two sets of circumstances. The first set of circumstances, in underlined font, describes events that are clearly emergency situations. However, the second set of circumstances, in italicized font, could be interpreted as including both emergency and non-emergency situations. The language in italics should be revised to clearly indicate that the described circumstances must be emergencies.

79. Port Arthur Pipeline is also directed to correct a reference in section 13.10.2(b) of the GT&C that incorrectly describes the order in which it will curtail services as set forth in "this Section 13.10.2(c)" rather than "13.10.2(b)" which is the appropriate section.

80. Section 13.10.7(a) of the GT&C provides in part:

> In the event Pipeline is unable to make deliveries of the quantities of gas to which Shipper has firm entitlements on any Gas Day and to which Shipper

---

[97] NAESB, WGQ Definition 1.2.6, v. 3.0.; *Rover*, 158 FERC ¶ 61,109 at P 127.

[98] *Ryckman Creek Resources, LLC*, 136 FERC ¶ 61,061, at P 68 (2011); *MarkWest Pioneer, L.L.C.*, 125 FERC ¶ 61,165 at P 52.

> has nominated for delivery from a Primary Receipt Point to a Primary Delivery Point under a firm Rate Schedule, Pipeline shall provide a credit applicable to the quantities of gas that were nominated and confirmed by Shipper's supplier, but not delivered; provided, however, Pipeline shall not be relieved of the obligation to provide credits for failure to confirm a nomination for reasons within its control.

81. The Commission requires pipelines to provide reservation credits based on the amount of primary firm service the shipper nominated, which the pipeline was unable to schedule or deliver.[99] Therefore, Port Arthur Pipeline is directed to remove the requirement from section 13.10.7 of the GT&C that credits must be based only on nominated and confirmed quantities that were not delivered.

j. Operational Purchases and Sales

82. Section 13.12.11 of the GT&C states in part:

> Pipeline is not providing a gas supply service under any Rate Schedule of Pipeline's Tariff. Without limiting the foregoing, Pipeline may buy and sell gas to the extent necessary to maintain system pressure and balance, to implement the cashout provisions in this Section 13.12 and to perform other functions necessary in connection with providing gas transportation service.

83. The Commission requires pipelines to include in their tariffs specific provisions addressing operational sales and purchases of gas.[100] These provisions include: (a) the specific circumstances in which the pipeline will perform an operational purchase or sale; (b) a statement that operational purchases or sales have a lower transportation priority than firm transportation and there will be no transportation service associated with its operational purchases or sales of gas; (c) a statement that operational sales service is unbundled from transportation service; (d) posting and bidding procedures for the sale of gas for operational purposes; and (e) a commitment to filing an annual report of sales and purchases and revenues derived from the sale of gas.[101] The report must indicate the

[100] *Rover*, 158 FERC ¶ 61,109 at P 132; *ANR Pipeline Co.,* 110 FERC ¶ 61,069, at P 57 (2006) (*ANR*); *Colorado Interstate Gas Co.,* 107 FERC ¶ 61,312, at P 15 (2004), *order on reh'g,* 111 FERC ¶ 61,216 (2005); *Dominion Trans., Inc.,* 106 FERC ¶ 61,029, at P 17 (2004).

[101] *ANR*, 110 FERC ¶ 61,069 at P 57.

source of gas, date of the purchase or sale volumes, purchase or sale price, costs and revenues from purchase or sale, and the disposition of the costs and revenues. Section 13.12.11 of the GT&C conforms with the first required provision; however, Port Arthur Pipeline is required to file revised tariff language that incorporates the remaining provisions required for operational sales and purchases of gas.

k. Force Majeure Definition

84. Section 13.21.1 of the GT&C, in part, defines a force majeure as "any other cause, whether of the kind herein enumerated, or otherwise, not within the control of the party claiming suspension and which by the exercise of Good Utility Practice, reasonable care and due diligence such party is unable to prevent or overcome." The Commission has defined force majeure outages as events that are both "unexpected and uncontrollable."[102] Therefore, we direct Port Arthur Pipeline to revise this portion of section 13.21 of the GT&C accordingly.

l. Liability

85. In various sections of its tariff,[103] Port Arthur Pipeline proposes to limit its liability to damages resulting from "gross negligence or willful misconduct." The Commission has consistently held that a simple negligence standard is appropriate for the liability and indemnification provisions of open access tariffs, as this standard prohibits pipelines from limiting their liability in a way that would immunize them from direct damages resulting from simple negligence and "gives service providers a powerful incentive to operate their systems in a reasonable and prudent manner."[104] The Commission has, however, allowed pipelines to limit their liability for simple negligence to direct damages, so that they are

[102] *North Baja Pipeline, LLC v. FERC*, 483 F.3d 819, 823 (D.C. Cir. 2007), *aff'd*, *North Baja Pipeline, LLC*, 109 FERC ¶ 61,159 (2004), *order on reh'g*, 111 FERC ¶ 61,101 (2005). *See also*, *e.g.*, *Kinder Morgan Louisiana Pipeline LLC,* 154 FERC ¶ 61,145 at P 29 (2016); *Algonquin Gas Transmission, LLC*, 153 FERC ¶ 61,038 at P 103 (2015).

[103] *See, e.g.* sections 13.5.1, 13.10.6, 13.14.1, and 13.18 of the GT&C.

[104] *See, e.g.*, *Trailblazer Pipeline Co. LLC*, 142 FERC ¶ 61,007, at P 8 (2012); *CenterPoint Energy Gas Transmission Co., LLC*, 139 FERC ¶ 61,064, at P 19 (2012); *Orbit Gas Storage, Inc.*, 126 FERC ¶ 61,095, at P 58 (2009)).

only liable for indirect, consequential, incidental, or punitive damages where there is gross negligence, willful misconduct, or bad faith.[105]

86. Port Arthur Pipeline's proposed liability standard is inconsistent with Commission policy, as it immunizes the pipeline from direct damages resulting from simple negligence. Therefore, Port Arthur Pipeline is directed to revise the liability standard in its *pro forma* tariff so as to not exclude it from liability for direct damages arising from its own simple negligence.

87. Section 13.21.5 of the GT&C provides, in part:

> Shipper warrants that all upstream and downstream transportation and/or service arrangements are in place, or will be in place as of the requested effective date of service, and that it has advised the upstream and downstream operators of the Receipt Point(s) and Delivery Point(s) under Shipper's Service Agreement(s) and any quantity and quality limitations for each point as specified on Exhibits A and B attached to the effective Service Agreement(s) or elsewhere in this Tariff. Shipper agrees to indemnify and hold Pipeline harmless for refusal to transport gas hereunder in the event any upstream or downstream operator fails to receive or deliver gas as contemplated by this Tariff.

88. Section 13.21.5 of the GT&C, could be interpreted to provide that Port Arthur Pipeline would be held harmless if it refuses to transport gas in the event any upstream or downstream operator fails to receive or deliver gas, whether or not Port Arthur Pipeline is also negligent. This would be inconsistent with Commission's adoption of a comparative negligence standard that would hold the pipeline liable for its proportional share of responsibility.[106] The Commission has prohibited pipelines from limiting their liability in circumstances wherein the pipeline and another party have both acted negligently. Port Arthur Pipeline is directed to revise its tariff accordingly.

---

[106] *Petal Gas Storage, L.L.C.*, 124 FERC ¶ 61,082, at P 28 (2008) (citing *Koch Gateway Pipeline Co.*, 65 FERC ¶ 61,338, at 62,619 (1993)).

m. Fuel Adjustment Mechanism

89. Section 13.22.4 of the GT&C provides in part:

> On or prior to April 1 of each Year, Pipeline will make a filing with the Commission to adjust the Fuel Retainage Percentage to reflect the annual calculations of the Base Fuel Retainage Percentage and the Fuel Retainage Percentage True-Up Adjustment, with such adjustment to the Fuel Retainage Percentage to become effective as of May 1 of the same Year.

90. We approve section 13.22.4 of the GT&C subject to Port Arthur Pipeline revising the section to clarify that the filing described therein refers to a limited section 4 filing under the NGA. This revision is necessary because section 13.35 of the GT&C (Reports with Respect to Tariff) describes the annual fuel adjustment filing in section 13.22 of the GT&C as a report. The language quoted above in section 13.22.4 of the GT&C could therefore be interpreted under section 13.35 of the GT&C as permitting Port Arthur Pipeline to change its fuel retention charge only through simply posting and filing such changes, rather than making a limited NGA section 4 filing that proposes and supports such changes with the opportunity for shippers to review and challenge the basis for the changes. Fuel retention charges are rates under the NGA. Posting of changed rates cannot be in lieu of any other rate change filing required by NGA section 4.[107] In addition, Port Arthur Pipeline is directed to delete from section 13.35 of the GT&C the reference to a "Fuel Retainage Percentage report in accordance with GT&C's Section 13.22."

n. Penalty Crediting

91. Section 13.25 of the GT&C provides that Port Arthur Pipeline will credit on an annual basis to non-offending customers penalty revenues net of costs assessed for "unauthorized overruns or under-deliveries, failures to abide by an OFO or curtailment order, takes in excess of scheduled quantities and other misconduct…" Section 13.25 further states that "[i]f such penalty revenue net of costs for a Year, plus any amounts carried over from prior Years, is less than $400,000, then Port Arthur Pipeline may carry such balance of revenue forward to the next Year."

92. Section 13.25 of the GT&C does not provide for payment of interest on net penalty revenues held by Port Arthur Pipeline. The Commission finds that Port Arthur Pipeline's proposal not to credit interest on accumulated penalty revenue is inconsistent with the Commission's goal in Order No. 637 to eliminate the pipelines' financial

[107] *See ANR Pipeline Co.*, 139 FERC ¶ 61,238, at P 157 (2012) (rejecting a proposed posting-only fuel rate proposal).

(continued ...)

incentive to retain penalty revenues.[108] Consistent with Commission policy,[109] Port Arthur Pipeline must revise its tariff to provide that it will credit the penalty revenues including the interest that it has accrued to shippers in a manner consistent with Commission regulations.[110]

o. Interruptible Transportation Revenue Sharing

93. Section 13.26 of the GT&C (Interruptible Transportation and Storage, Load Management and Authorized Overrun Service Revenue Sharing) provides that the pipeline will credit revenues under Rate Schedules IT, P&L, and AOS (among others):

> to each of Pipeline's firm transportation and storage service Shippers (including a firm Shipper that pays a Negotiated Rate to the extent negotiated by Pipeline and Shipper on a not unduly discriminatory basis) based on the Shipper's pro rata share of total MDTQs and MDWQs in all of the Pipeline's firm transportation and storage Service Agreements.

94. The Commission's long-standing policy regarding new interruptible services requires either a 100 percent credit of the interruptible revenues, net of variable costs, to maximum rate firm and interruptible customers or an allocation of costs and volumes to these services.[111] Port Arthur Pipeline has chosen the crediting option. However, Port Arthur Pipeline does not propose to provide credits to maximum rate interruptible customers, and although proposing to credit interruptible revenues on a yearly basis, does

---

(continued ...)

not propose to pay interest on these funds that it may retain for up to twelve (12) months. The Commission requires Port Arthur Pipeline to pay interest on the accumulated balances consistent with Commission regulations,[112] and to include maximum rate interruptible customers in its revenue crediting proposal.

95. Moreover, with regard to permitting negotiated rate shippers to receive such credits, the Commission has held that a pipeline may agree to provide shippers paying negotiated rates with credits after eligible recourse rate shippers have been credited with 100 percent of interruptible revenues net of variable costs.[113] Negotiated rate shippers may receive such credits as a component of an individually negotiated rate rather than by virtue of the Commission's policy on interruptible revenue crediting. Accordingly, as provisions of a negotiated rate, such credits are required to be reported in a negotiated rate tariff filing. Therefore, we direct Port Arthur Pipeline to remove from section 13.26 of the GT&C provisions referring to the eligibility of negotiated rate shippers to receive interruptible revenue credits.

p. NAESB Standards

96. Port Arthur Pipeline reflects tariff provisions in section 13.38 of the GT&C (NAESB) implementing the NAESB WGQ Version 3.0 business practice standards that the Commission incorporates by reference in its regulations.[114] In the time since Port Arthur Pipeline filed its proposed tariff in this proceeding, the Commission adopted the new NAESB WGQ Version 3.1 business practice standards.[115] Thus, we direct Port Arthur Pipeline to file revised tariff records, no less than 60 days prior to its in-service date, implementing the NAESB WGQ Version 3.1 business practice standards. Further, Port Arthur Pipeline is directed to revise its tariff accordingly to:

1. include standard 0.2.5 in a section titled "Definitions:" under the heading "Additional Standards: – General:" in section 13.8 of the GT&C;

---

[112] 18 C.F.R. § 154.501(d) (2018).

[113] *Wyoming Interstate Co., Ltd.*, 121 FERC ¶ 61,135, at P 9 (2007).

[114] 18 C.F.R. § 284.12(a) (2018).

[115] *Standards for Business Practices of Interstate Natural Gas Pipelines,* Order No. 587-Y, 83 Fed. Reg. 62,242 (Dec. 3, 2018), 165 FERC ¶ 61,109 (2018). Under Order No. 587-Y, interstate natural gas pipelines are required to file compliance filings with the Commission by April 1, 2019, and are required to comply with the Version 3.1 standards incorporated by reference in this rule on and after August 1, 2019.

2. remove standard 0.2.5 from section titled "Gas/Electric Operational Communications:" in section 13.8 of the GT&C; and

3. remove standard 5.3.73 from section titled "Standards Incorporated by Reference:" in section 13.8 of the GT&C, as the text of the standard is already included in section 13.11.9 of the GT&C (Capacity Release - Requests to Purchase Capacity).

q. Off-system Capacity

97. Section 13.43 of the GT&C (Off-System Capacity) provides:

> Pipeline may enter into a transportation agreement(s) with other interstate and intrastate pipeline companies to acquire transportation or storage capacity or rights ("off-system capacity"). In the event that Pipeline acquires off-system capacity, Pipeline will use such capacity for operational reasons or to render service for its Shippers within a Zone. In the event that Pipeline uses off-system capacity to render service for its Shippers, it will only render service to the Shippers within the Zone on the acquired capacity pursuant to this Tariff and subject to Pipeline's approved rates, as such tariff and approved rates may change from time to time. For purposes of transactions entered into subject to this GT&C Section 13.43, the "Shipper-Must-Have-Title" requirement is waived. When off-system capacity is not required for operational reasons or to meet firm service commitments, Pipeline will offer the off-system capacity to Shippers on a primary firm basis within the Zone. This GT&C Section 13.43 does not preclude Pipeline from seeking case specific authorization for the utilization of off-system capacity by Pipeline for other purposes, nor does it preclude Pipeline from releasing any capacity it holds on off-system pipeline companies.

98. We find this language to be consistent with the Commission's *Texas Eastern* policy concerning the acquisition of upstream capacity by interstate pipelines.[116] Therefore, we will grant a generic waiver of the "shipper must hold title" policy for any such transportation that the pipeline subsequently provides.

[116] *Texas Eastern Transmission Corp.*, 93 FERC ¶ 61,273 (2000), *reh'g denied,* 94 FERC ¶ 61,139 (2001).

(continued ...)

V. Environmental Analysis

99. To satisfy the requirements of the National Environmental Policy Act of 1969 (NEPA),[117] Commission staff evaluated the potential environmental impacts of the proposed projects in an EIS. The U.S. Army Corps of Engineers (USACE), Galveston District, U.S. Coast Guard, U.S. Environmental Protection Agency (EPA), U.S. Department of Transportation (DOT), Pipeline and Hazardous Materials Safety Administration (PHMSA), and DOE participated as cooperating agencies in the preparation of the EIS. Cooperating agencies have jurisdiction by law or special expertise with respect to resources potentially affected by the proposals and participate in the NEPA analysis.

100. Commission staff issued the draft EIS on September 28, 2018, which addressed the issues raised during the scoping period and up to the point of publication. Notice of the draft EIS was published in the *Federal Register* on October 5, 2018,[118] establishing a 45-day public comment period ending on November 19, 2018. The *Notice of Availability of the Draft Environmental Impact Statement for the Proposed Port Arthur Liquefaction Project, Texas Connector Project, and Louisiana Connector Project* was mailed to the environmental mailing list for the projects. Commission staff held three public comment sessions between October 16 and 18, 2018, to receive comments on the draft EIS.[119] A total of 17 people commented at the sessions. In addition, 17 parties submitted a total of 22 letters in response to the draft EIS. In addition, on November 30, 2018, Port Arthur LNG and Port Arthur Pipeline filed responses to several comments on the draft EIS. The transcripts of the public comment sessions and all written comments on the draft EIS are part of the public record for the projects.

101. On January 31, 2019, Commission staff issued the final EIS for the projects, and a public notice of the availability of the final EIS was published in the *Federal Register* on February 6, 2019,[120] and mailed to the environmental mailing list for the projects.[121] The final EIS addresses geology; soils; water resources; wetlands; vegetation; wildlife and aquatic resources; threatened, endangered, and other special status species; land use,

---

[117] 42 U.S.C. §§ 4321 *et seq.* (2012). *See also* the Commission's NEPA-implementing regulations at Title 18 of the C.F.R., Part 380.

[118] 83 Fed. Reg. 50,362.

[119] Commission staff held the public comment sessions in Kinder and Sulfur, Louisiana, and Port Arthur, Texas.

[120] 84 Fed. Reg. 2221.

[121] The distribution list is provided in Appendix A of the final EIS.

recreation, and visual resources; socioeconomics; cultural resources; air quality and noise; safety; cumulative impacts; alternatives; and all substantive comments received on the draft EIS. The final EIS concludes that construction and operation of the projects will result in some adverse environmental impacts, but impacts will be reduced to less-than-significant levels with the implementation of Port Arthur Pipeline and Port Arthur LNG's proposed, and Commission staff's recommended, mitigation measures which are included as conditions in the appendix to this order, as discussed below. No adverse comments concerning the final EIS have been filed. Resource areas addressed in the final EIS are addressed below.

1. Geology

102. The overall effect of the Liquefaction Project, the Texas Connector Project, and Louisiana Connector Project on topography and geology would be minor. Geologic impacts would be limited to construction activities and would include disturbance of slopes within the work areas.[122] However, some hazards such as severe flooding, storm surges, high winds, erosion along the shoreline and docking facilities, and potential site access interruptions could affect the Liquefaction Project during operation.[123] Port Arthur LNG has incorporated structural and mechanical elements into the design of the liquefaction facilities.[124] Further, Port Arthur LNG would construct a storm surge barrier of improved soil and structural clay to a top elevation of 20 feet.[125] Port Arthur LNG would also monitor foundations and other critical facilities to ensure they are maintained within acceptable limits.[126] Along the pipelines, Port Arthur Pipeline would implement buoyancy control measures such as concrete-coated piping, anchors, or aggregate-filled saddle bags to weigh the pipe in wet areas, and would periodically monitor the pipeline right-of-way during operation to aid in identification of subsidence-related conditions that may require maintenance.[127] Port Arthur LNG and Port Arthur Pipeline do not anticipate that any blasting will be required during construction of the projects.[128] Based on Port

[125] Final EIS at 5-3.

[126] Final EIS at 4-6.

[127] Final EIS at 5-2.

[128] Final EIS at 5-2.

(continued ...)

Arthur LNG's and Port Arthur Pipeline's proposed mitigation and design criteria, and Commission staff's recommended mitigation measures, included in the appendix to this order, the final EIS concludes that the Liquefaction Project, the Texas Connector Project, and Louisiana Connector Project will not significantly impact or be impacted by geological conditions in the area.

2. Soils

103. Construction of the Liquefaction Project, the Texas Connector Project, and Louisiana Connector Project could affect soil resources by increasing the potential for erosion, compaction, mixing of topsoil, and rutting.[129] The Liquefaction Project site and dredge disposal areas contain clay and peat soils prone to compaction.[130] In order to increase the load bearing capacity of soils along the heavy haul road, an engineered grout would be added to the subsoil that would permanently alter the physical characteristics of 7.5 acres of soils at the liquefaction facilities.[131] Operation of the compressor stations and other aboveground facilities along the pipelines for the Louisiana Connector and Texas Connector projects would permanently affect 105.7 acres of prime farmland but would not result in a significant reduction of usable prime farmland soils in the area.[132] In addition to the earthen berm, about 4.4 million cubic yards of fill would be used on the remainder of the liquefaction facilities site. Port Arthur LNG would further armor the Port Arthur Canal adjacent to the site by means of riprap or other erosion prevention measures, and would develop a Shoreline Protection Report to address potential shoreline erosion that may occur during operations in the shoreline zone.[133]

104. In response to the EPA's June 30, 2016 comments on Port Arthur LNG's draft resource reports 1 and 10,, Port Arthur LNG committed to resampling sediments at the landward component of the marine offloading facility prior to dredging and disposal. Environmental Condition 17 in the appendix to this order requires Port Arthur LNG to provide the EPA, USACE, Texas Commission on Environmental Quality, and Texas Railroad Commission with this final soil and sediment analysis from the area within the ship canal at the marine berth, construction dock, material offloading facility, and landward component of the material offloading facility for review. This condition also

[129] Final EIS at 5-2.

[130] Final EIS at 5-2.

[131] Final EIS at 5-3.

[132] Final EIS at 5-2.

[133] Final EIS at 5-3.

(continued ...)

requires Port Arthur LNG to file its consultation with these agencies with the Commission.

3. Water

105. Potential impacts on groundwater resources are anticipated to be minor and temporary. Most construction activities associated with the liquefaction and pipeline facilities would involve shallow, temporary, and localized excavation, with the exception of concrete and steel piles for LNG vessel loading facilities and LNG tanks. Piles required for the LNG storage tanks and LNG ship loading and berthing areas would be driven to a depth no lower than 160 feet and are not expected to have direct impacts on the underlying aquifer. [134] During construction of the Louisiana Connector and Texas Connector projects, shallow groundwater could be encountered within the first 3 feet below grade within Jefferson and Orange Counties, Texas and in Cameron, Calcasieu, and Beauregard Parishes, Louisiana, and should Port Arthur Pipeline need to pump water from a pipeline trench, it would be pumped through filter bags prior to discharge.[135] No drinking water wells or identified springs are within 150 feet of the Liquefaction Project. There are no known groundwater withdrawal wells, drinking water wells, designated well head protection areas, or springs within 150 feet of the Texas Connector Project in Texas and Louisiana. There are 16 known groundwater withdrawal or drinking water wells within 150 feet of the Louisiana Connector Project in Louisiana, and none in Texas.[136]

106. Construction of the Liquefaction Project, the Texas Connector Project, and Louisiana Connector Project would impact bodies of water, including lakes, canals, rivers and streams. To minimize and mitigate impacts on surface waters and aquatic resources Port Arthur LNG proposed to utilize dry excavation methods, install a 30-inch-diameter pipeline to safely transport dredge material to the dredge disposal area, and install a shoreline protection system to prevent post-construction erosion.[137] Port Arthur Pipeline would implement its Environmental Plan (including the Commission's *Upland Erosion Control, Revegetation & Maintenance Plan* [Plan] and *Wetland and Waterbody Construction and Mitigation Procedures* [Procedures]) to minimize erosion and sedimentation resulting from the construction of the Louisiana Connector and Texas Connector projects. Port Arthur Pipeline proposes to utilize the horizontal directional drill (HDD) crossing method at 46 waterbody crossings for the Louisiana Connector

[134] Final EIS at 5-4.

[135] Final EIS at 5-4.

[136] Final EIS at 5-3 – 5-4.

[137] Final EIS at 5-4 – 5-5.

(continued ...)

Project, and at 24 crossings for the Texas Connector Project, in order to avoid impacts on surface water resources.[138] In compliance with the Commission's Procedures, and prior to construction, Port Arthur Pipeline would provide Commission staff with finalized detailed plans for each HDD crossing and prepare final contingency plans in the event an HDD crossing is unsuccessful.[139] Therefore, the final EIS concludes that impacts on water resources will be adequately minimized and are not significant.

4. Wetlands

107. Construction of the Liquefaction Project would affect a total of 1,661.9 acres of wetlands, of which 724.0 acres would be permanently filled. Port Arthur LNG would offset impacts on USACE jurisdictional wetlands through mitigation measures included in its project Compensatory Mitigation Plan. The mitigation measures include the beneficial reuse of over 7.8 million cubic yards of dredge material excavated from the ship berthing area and Pioneer Dock. The beneficial reuse of this material would create about 1,268.8 acres of coastal marsh wetland. Port Arthur LNG's wetland mitigation would include adhering to the measures in the Commission's Procedures, as well as Port Arthur LNG's Compensatory Mitigation Plan.

108. Construction and operation of the Texas Connector Project and Louisiana Connector Project would affect about 238.1 acres and 636.9 acres of wetlands, respectively, of which 66.8 acres and 244.1 acres, respectively, would be permanently disturbed during operation of the projects. Port Arthur Pipeline would implement the mitigation measures outlined in its project-specific Environmental Plan (including the Commission's Procedures), and will be required to comply with any mitigation measures identified in the USACE permit conditions for the pipeline projects.

109. With the implementation of Port Arthur LNG's and Port Arthur Pipeline's Project-specific plans, Port Arthur LNG's proposed beneficial use of dredge material to restore emergent wetlands, the proposed mitigation measures discussed in the final EIS, the final EIS concludes that impacts on wetland resources will be adequately minimized and are not significant.

5. Vegetation

110. Construction and operation of the Liquefaction Project, the Texas Connector Project, and Louisiana Connector Project would affect a total of 1,206.5 acres and 5,767.0 acres of forested and open land vegetation types, respectively. About 845.3 acres

[138] Final EIS at 5-6.

[139] Final EIS at 5-6.

(continued ...)

of vegetation would be cleared during construction of the Liquefaction Project, and 808.0 acres would be permanently converted to industrial use associated with operation of the Liquefaction Project. Additionally, 151.0 acres of open water would be created for operation of the Liquefaction Project.[140] Port Arthur LNG would deposit some of its dredged material at the J.D. Murphree wildlife management area (WMA) where it would be used to create coastal marshland, and revegetate other impacted areas of the WMA.[141] As a result of Port Arthur LNG's proposed mitigation measures, including development of its wetland Compensatory Mitigation Plan and the beneficial reuse of dredge materials at J.D. Murphree WMA, the final EIS concludes that impacts on vegetation from construction and operation of the Liquefaction Project will be permanent but minor.

111. Construction of the Louisiana Connector and Texas Connector projects would disturb a total of 482.8 acres and 2,044.1 acres of vegetated land, respectively, including open and forested upland and wetland areas. Impacts on vegetation associated with installation of the pipelines would primarily be caused by vegetation clearing within the construction right-of-way and associated additional temporary work space. About 184.4 acres of upland forest would be permanently affected along the pipeline routes. Except for the 410.0 acres within the permanent right-of-way that would be crossed by HDD, vegetation would be cleared from the entire working right-of-way.[142]

112. No vegetation communities of special concern would be impacted by the Liquefaction Project or the Texas Connector Project; however, portions of the Louisiana Connector Project's route crosses a Coastal Prairie community, and a stand of western acidic longleaf pine savannah/flatwoods.[143] Port Arthur Pipeline's Environmental Plan would facilitate the restoration of the Coastal Prairie community upon completion of construction.[144] In addition, impacts on the western acidic longleaf pine savannah/flatwoods would be minor, as the stand is already disturbed by existing silviculture management, and Port Arthur Pipeline proposes to use an existing logging road to access the area, further reducing impacts.[145] Port Arthur Pipeline would also use its Environmental Plan to minimize the spread of invasive aquatic species, and implement

[140] Final EIS at 5-8.

[141] Final EIS at 5-9.

[142] Final EIS at 5-9.

[143] Final EIS at 5-9.

[144] Final EIS at 4-77.

[145] Final EIS at 4-78.

(continued ...)

measures in the Commission's Plan and Procedures to evaluate the success of revegetation efforts.[146] Therefore, based on the minor nature of the impacts on vegetation, and Port Arthur LNG and Port Arthur Pipeline's proposed efforts to further mitigate these impacts, the final EIS concludes that the projects will not have a significant impact on vegetation.

6. Wildlife

113. In total, approximately 7,828.1 acres of wildlife habitat would be affected by construction of the Liquefaction Project, and the Louisiana Connector and Texas Connector projects. While 6,003.1 acres would be affected during operations of the projects, the majority of these impacts would occur at the dredge disposal areas. Overall, the greatest impacts would be on open wetland habitat, followed by open upland and forested upland habitats, which are discussed above. Due to existing industrial activity in the area, wildlife in the vicinity of the Liquefaction Project is anticipated to be acclimated to the impacts of construction and operations, particularly impacts associated with noise and artificial light.[147] However, Port Arthur LNG proposes several additional measures including directing lighting downward during construction, use of nesting inhibitors to discourage nesting of migratory birds near the Liquefaction Project, and utilizing ground flares instead of elevated flares during operation, to further minimize impacts on migratory birds.[148]

114. Construction of the Louisiana Connector and Texas Connector projects would affect 2,526.5 acres of vegetated wildlife habitat, with the greatest impact on open upland habitat, and operation would permanently convert 816.3 acres of wildlife habitat.[149] Most impacts on wildlife would be limited to the duration of construction for the Louisiana Connector and Texas Connector projects, and abundant habitat is available for wildlife in the vicinity. Port Arthur Pipeline proposes to conduct surveys for bald eagle nests prior to construction, and to modify the construction schedule in the event a nest is located. Port Arthur Pipeline would implement its project-specific Environmental Plan to further

[146] Final EIS at 5-10.

[147] Final EIS at 4-86.

[148] Final EIS at 5-10 – 5-11.

[149] Final EIS at 5-10.

(continued ...)

minimize impacts.[150] Therefore, the final EIS determined that impacts on wildlife from construction and operation of the projects will not be significant.

7. Aquatic Resources

115. Impacts on aquatic resources from construction and operation of the Liquefaction Project include increased turbidity and sediment suspension, increased in-water noise, increased vessel traffic, and alteration of light regimes.[151] Port Arthur LNG proposes to minimize turbidity and sediment suspension by commencing construction from the landward side, working its way into the Port Arthur Canal, and would use hydraulic dredging techniques to retain much of the entrained sediment.[152] Port Arthur LNG would also implement construction techniques that minimize noise effects on aquatic species, including pre-drilling pile holes, the use of a vibratory hammer, bubble curtains/ cofferdams, and gradually increasing the power and frequency of pile driving over a period of time, which would allow sensitive aquatic species to depart the area before harmful underwater sound pressures are created by the vibratory hammers. Impacts from increased ship traffic due to the Liquefaction Project would be mitigated by installation of rip-rap to reduce shoreline erosion, as well as implementation of existing U.S. Coast Guard ballast water requirements, among other mandatory federal requirements.[153]

116. Potential impacts on aquatic resources related to construction and operation of the Louisiana Connector and Texas Connector projects would be associated with increased erosion and sedimentation due to open-cut waterbody crossings, inadvertent release of drilling mud during HDD crossings, physical or chemical water alterations from hydrostatic testing, entrainment from water appropriation for hydrostatic testing, and any inadvertent spills of hazardous materials. Port Arthur Pipeline would implement the measures outlined in its Environmental Plan to minimize impacts on waterbodies and aquatic resources during pipeline construction, including reducing workspace areas near waterbodies, establishing buffers to prevent stormwater run-off from entering waterbodies, and installing erosion control devices, as well as minimizing response time and ensure appropriate cleanup actions are taken in the event of a spill.[154] Port Arthur Pipeline would also implement its HDD Contingency Plan to minimize impacts in the

[150] Final EIS at 5-11.

[151] Final EIS at 5-12.

[152] Final EIS at 5-11.

[153] Final EIS at 5-12.

[154] Final EIS at 5-12 – 5-13

(continued ...)

case of an inadvertent return of drilling mud. Once construction is complete, streambeds and banks would be restored to their preconstruction conditions and contours to the maximum extent practicable, which would aid in preventing erosion and minimize long-term impacts on aquatic resources.[155]

117. Construction and operation of the Liquefaction Project, the Texas Connector Project, and Louisiana Connector Project would also result in temporary and permanent impacts on essential fish habitat (EFH). Construction and operation of the Liquefaction Project would affect 3.2 acres of estuarine water column and estuarine mud/soft bottom EFH, which would result in temporary and permanent impacts. However, the Liquefaction Project would create 68.3 acres of additional open water habitat for aquatic species and EFH-managed species by dredging the berthing area and material offloading facility, resulting in a net increase of estuarine mud/soft bottom and estuarine water column EFH.[156]

118. Construction of the Texas Connector Project would temporarily impact 1.2 acres, 8.4 acres, and 0.8 acre of estuarine emergent marsh EFH, respectively.[157] Construction of the Louisiana Connector Project would temporarily affect 1,534.7 acres of EFH, including 131.7 acres of estuarine emergent marsh EFH and 1,403.0 acres of estuarine water column and mud/soft bottom EFH. Permanent access roads required for the operation would permanently affect 1.7 acres of EFH, 1.2 acres of estuarine emergent marsh, and 0.5 acre of estuarine water column and estuarine mud/soft bottom.[158] Port Arthur LNG and Port Arthur Pipeline coordinated with the National Marine Fisheries Service (NMFS) on potential impacts on EFH. In an email to Commission staff on October 5, 2018, NMFS ultimately determined that "with the use of avoidance and minimization construction techniques as well as the wetlands restoration activities, the project would result in temporary and minimal impacts to EFH. Therefore, the EFH consultation required by the Magnuson-Stevens Fishery Conservation and Management Act is concluded and no further coordination with the NMFS is required."[159]

119. Due to the proposed HDD crossings at over 50 locations to avoid impacts on waterbodies, Port Arthur Pipeline's proposal to limit construction workspace and

[155] Final EIS at 5-14.

[156] Final EIS at 5-14.

[158] Final EIS at 5-14 – 5-15.

[159] Final EIS at 5-15.

(continued ...)

duration at the waterbody crossings, and implementation of the proposed mitigation measures, the final EIS concludes that the projects would have minor and localized impacts on aquatic resources, including EFH.

8. Threatened, Endangered, and Other Special Status Species

120. According to the U.S. Fish and Wildlife Service (FWS) and NMFS, 26 federally listed or proposed species may occur in the counties and parishes impacted by the projects.[160] Commission staff determined that the projects would have no effect or not be likely to adversely effect 25 of the 26 listed or proposed species.[161] The remaining species, the eastern black rail (type of bird), was proposed for listing by the FWS in the *Federal Register* on October 9, 2018.[162] As required by section 7 of the Endangered Species Act of 1978, Commission staff requested that FWS and NMFS accept the information in the draft EIS as the Biological Assessment for the projects. On August 29, 2018, NMFS provided concurrence for the species under its jurisdiction.[163] The final EIS reports that consultation with FWS is ongoing for the American chaffseed, and may be required for the eastern black rail. Environmental Condition 19 in the appendix to this order requires completion of Endangered Species Act consultation before construction may begin.

9. Land Use, Recreation, and Visual Resources

121. Construction of the projects would temporarily affect a total of 10,612.0 acres of land. Of this, approximately 2,660 acres would be allowed to revert to the existing land use type after the completion of construction, and approximately 7,953 acres would be permanently affected by the projects' operation. The projects' construction would temporarily affect a total of approximately 521 acres of agricultural land, and approximately 176 acres would be included in permanent right-of-way.[164] The EIS states that agricultural land located within the pipeline permanent rights-of-way would be

[160] Final EIS at 5-15.

[161] Final EIS at 5-15.

[162] *Federal Register*, 83 Fed. Reg. 50,610 (2018).

[163] Final EIS at 4-131.

[164] Final EIS at 5-17.

(continued ...)

restored to previous use approximately one growing season after the completion of construction.[165]

122. The Louisiana Connector and Texas Connector Project's construction workspaces would be located within 50 feet of 24 and 11 residential structures, respectively; the Liquefaction Project's construction workspace is not within 50 feet of any residential structures.[166] The draft EIS and final EIS included site-specific plans for residential structures within 25 feet of the construction workspaces. No comments were received from landowners regarding these site-specific plans.

123. Construction of the projects would occur near several recreation areas, including the J.D. Murphree WMA, Round Lake, Keith Lake, and private hunting grounds.[167] Generally speaking, however, impacts on recreation areas would be temporary and limited to the duration of construction – which would extend from several days to several weeks depending on the area of construction.[168]

124. The Liquefaction Project includes many aboveground structures that could result in a visual resource impact, including three LNG storage tanks that would be approximately 256 feet tall, liquefaction trains, and additional infrastructure, most of which would require lighting. The Liquefaction Project would be sited along the Port Arthur Canal, which would create a strong vertical visual contrast across a relatively flat existing landscape.[169] The ship berths, offloading facilities, and utility buildings would also alter the existing viewshed. The storage tanks and liquefaction facilities would not be screened and would result in permanent visual impacts on views from the eastern edge of the nearby J.D. Murphree WMA. Impacts on views for those traveling on State Highway 87 and State Highway 82, visiting Pleasure Island or the Port Arthur Canal, boaters in the waterway, and viewers from a variety of recreational locations would be relatively minor due to existing industrial facilities surrounding and northeast of the project area.[170] Port Arthur LNG would restrict any permanent lighting needed for the Liquefaction Project terminal facilities to the property boundaries and direct the

[165] Final EIS at 5-17.

[166] Final EIS at 5-16.

[167] Final EIS at 5-17.

[168] Final EIS at 5-17.

[169] Final EIS at ES-7.

[170] Final EIS at ES-7.

(continued ...)

permanent lighting downward towards these sites.[171] The EIS concluded that because of the existing commercial, industrial, and developed nature of the area, including the existing Golden Pass liquefaction terminal within 3 miles of the proposed Liquefaction Project, impacts from facility siting and its lighting will be consistent with the area. The final EIS therefore concludes that land use, recreation, and visual resource impacts associated with the projects would be minor.

10. Socioeconomics

125. As stated in the EIS, construction of the projects would result in minor positive socioeconomic impacts from employment, and not have a significant adverse impact on local populations, employment, provision of community services, or property values.[172] Additionally, there would not be any disproportionately high or adverse environmental and human health impacts on low-income and minority populations.[173] Construction of the projects would result in minor, temporary impacts on local transportation infrastructure and traffic. Environmental Condition 23 in the appendix to this order requires Port Arthur LNG to file a Transportation Plan to outline how it would manage access to and from the Liquefaction Project construction site by personnel, equipment, and deliveries on a daily basis.

11. Cultural Resources

126. Commission staff is currently in the process of complying with section 106 of the National Historic Preservation Act for all projects.[174] Therefore, Environmental Condition 25 requires section 106 consultation be completed for all Project elements before Port Arthur LNG and Port Arthur Pipeline may commence construction. In addition, Commission staff, as well as staff from Port Arthur Pipeline have met with the Coushatta Tribe of Louisiana to address their concerns over the Louisiana Connector Project's potential impacts on cultural resources.[175] On November 15, 2018, the Coushatta Tribe filed a letter concurring with a determination that no historic properties would be affected by the Louisiana Connector Project; and Commission staff, Port Arthur

[174] Final EIS at 5-23.

[175] Final EIS at 5-23 – 5-24.

(continued ...)

Pipeline, and the Coushatta Tribe continue to work together to address the Tribe's cultural resource concerns.

12. Air Quality and Noise

127. Construction emissions for the Liquefaction Project are estimated for approximately 60 months. Construction emissions would not be a permanent source, and, therefore, not have a long-term effect on air quality in the area.[176] Most construction-related emissions from the Louisiana Connector and Texas Connector projects would be temporary and localized and would dissipate with time and distance from areas of active construction. Further, construction emissions along the pipelines would subside once construction is complete.[177]

128. Long-term impacts on air quality would result from operation of the Liquefaction Project facilities and the pipeline compressor stations. Port Arthur LNG and Port Arthur Pipeline would minimize potential impacts on air quality caused by operation of the liquefaction facilities and compressor stations by adhering to applicable federal and state regulations and installing best available control technology to minimize emissions.[178] Therefore, with the mitigation measures that Port Arthur LNG and Port Arthur Pipeline have proposed, the final EIS concludes that there would be no regionally significant impacts on air quality.[179]

129. Noise would be generated during construction of the projects. Noise levels would be highest in the immediate vicinity of construction activities and would diminish with distance from the work area.[180] These impacts would be localized and temporary. Construction would generally not affect nighttime noise levels as it would be limited to 7 a.m. to 10 p.m., except for pile driving, HDD activities, and specific construction activities such as tie-ins and hydrostatic testing.[181] For construction of the Liquefaction Project, the City of Port Arthur's noise standard for the noise sensitive areas (NSA) in residential areas would limit project-generated noise to no greater than 57 A-weighted decibels

[176] Final EIS at 5-22 – 5-23.

[177] Final EIS at 4-239.

[178] Final EIS at ES-7.

[179] Final EIS at ES-7.

[180] Final EIS at 4-248.

[181] Final EIS at 4-248.

(continued ...)

(dBA) during the day (7 a.m. to 10 p.m.) and 52 dBA at night (10 p.m. to 7 a.m.); however, construction-related noise is exempt from this standard provided that such activities do not take place during nighttime hours.[182]

130. During construction of the Louisiana Connector and Texas Connector projects, use of the HDD method would result in minor impacts on NSAs in the vicinity of the drilling equipment. Therefore, Environmental Condition 26 in the appendix to this order requires Port Arthur Pipeline, prior to the use of HDDs at locations where HDD-related noise could exceed Commission sound level criteria at NSAs, to file HDD noise mitigation plans.

131. Operation of the Liquefaction Project and the Texas Connector Project's South Compressor Station (located near the Liquefaction Project) would generate sound levels throughout the life of the projects, but the increase in noise levels would be below the "barely detectable" noise level increase of 3 dBA, and would be below the FERC limit standard of a day-night sound level (L_{dn}) of 55 dBA, resulting in only minor impacts on the nearest NSA.[183] Further, Environmental Condition 27 requires Port Arthur LNG to file a full-load noise survey no later than 60 days after each liquefaction train is put in service for the first and second liquefaction trains. Environmental Condition 27 also requires that if noise levels attributable to operation of the Liquefaction Project and South Compressor Station exceed the FERC limit of 55 dBA L_{dn}, Port Arthur LNG must reduce the facilities' noise contribution to result in a noise level that is no higher than the FERC standard. Environmental Condition 28 also requires Port Arthur LNG to file a full-load noise survey no later than 60 days after placing all the Liquefaction Project facilities and South Compressor Station in service.

132. Sound levels would increase during operation of the Texas Connector Project's North Compressor Station, the Louisiana Connector Project's compressor station, and the meter stations associated with the pipeline projects, which would occur for the life of the Louisiana Connector and Texas Connector projects. To reduce noise impacts, Port Arthur Pipeline would implement mitigation measures such as the use of acoustically treated compressor enclosures, silencers on the exhaust outlet and air intake, and acoustically treated wall and roof fan openings.[184] Based on Commission staff's noise analysis as reported in the final EIS, the predicted noise levels attributable to operation of the Texas Connector Project's North Compressor Station, the Louisiana Connector Project's compressor station, and the meter stations would be less than 55 dBA L_{dn} at all

[182] Final EIS at 4-248 – 4-249.

[183] Final EIS at 4-249 at 5-24.

[184] Final EIS at 5-24.

(continued ...)

nearby NSAs.[185] To ensure that noise levels would be below 55 dBA L_{dn}, Environmental Condition 29 requires Port Arthur Pipeline to file noise surveys during full-load operations and, if the noise levels exceed the FERC standard, that Port Arthur Pipeline install additional noise controls to meet the FERC standard within 1 year of the in-service date. The final EIS concludes that any increase in noise levels during construction and operation of the Liquefaction Project, Louisiana Connector Project, and Texas Connector Project would be minor and not result in significant impacts.

13. Reliability and Safety

133. Commission staff conducted a preliminary engineering and technical review of the Liquefaction Project, including potential external impacts based on the site location. Based on this review, the final EIS recommends a number of mitigation measures for implementation prior to initial site preparation, prior to construction of final design, prior to commissioning, prior to introduction of hazardous fluids, prior to commencement of service, and throughout life of the facility, to enhance the reliability and safety of the facility. These recommendations have been adopted as mandatory conditions in the appendix to this order. On September 11, 2015, the U.S. Coast Guard issued a Letter of Recommendation to the Commission indicating the Sabine Neches River Ship Channel would be considered suitable for accommodating the type and frequency of LNG marine traffic associated with the Liquefaction Project. If the LNG Facility is authorized and constructed, the facility would be subject to the USCG's inspection and enforcement program to ensure compliance with the requirements of 33 CFR 105 and 33 CFR 127. Based on Commission staff's external impact analysis and preliminary evaluation of the engineering design, and with the incorporation of these recommended mitigation measures and oversight, the final EIS concludes that the Liquefaction Project's design would include acceptable layers of protection or safeguards that would reduce the risk of a potentially hazardous scenario from developing into an event that could impact the offsite public.

134. Further, as noted above,[186] PHMSA determined that the siting of the proposed LNG facilities complies with the federal safety standards governing the location, design, construction, operation, and maintenance of LNG facilities. The PHMSA LOD summarizes PHMSA's evaluation of the hazard modeling results and endpoints used to establish exclusion zones, as well as its review of Port Arthur LNG's evaluation of potential incidents and safety measures that could have a bearing on the safety of plant personnel and the surrounding public.

---

[185] *Id.* at 4-249.

[186] *See supra* at P 26.

(continued ...)

135. Port Arthur Pipeline must design, construct, operate, and maintain its proposed pipelines and aboveground facilities in accordance with the DOT Minimum Federal Safety Standards.[187] These regulations, which are intended to protect the public and to prevent natural gas facility accidents and failures, include specifications for material selection and qualification, minimum design requirements, and protection of pipelines from corrosion. Accordingly, the final EIS concludes that Port Arthur Pipeline's compliance with the DOT's safety standards will ensure that Port Arthur Pipeline's construction and operation of the facilities would not have a significant impact on public safety.[188]

14. Greenhouse Gas Emissions

136. With respect to impacts from GHGs, the final EIS discusses the direct GHG impacts from construction and operation of the projects, the climate change impacts in the region,[189] and the regulatory structure for GHGs under the Clean Air Act.[190]

137. The final EIS estimated that operation of the Liquefaction Project and the Louisiana Connector and Texas Connector project's compressor stations may result in emissions of up to 4,722,648 metric tons per year of carbon dioxide equivalent (CO_2e).[191] To provide context to the direct GHG estimate, according to the national net CO_2e emissions estimate in the EPA's *Inventory of U.S. Greenhouse Gas Emissions and Sinks* (EPA 2018), 5.8 billion metric tons of CO_2e were emitted at the national level in 2016 (inclusive of CO_2e sources and sinks). The direct and indirect operational emissions of the LNG terminal could potentially increase CO_2e emissions based on the 2016 levels by

[187] 49 C.F.R. § 192 (2018).

[188] Final EIS at 4-312.

[189] Final EIS at 4-360 – 4-362.

[190] Final EIS at 4-228 and 4-231.

[191] Final EIS at Tables 4.11.1-7. CO_2e emissions in the final EIS are expressed in short tons, which have been converted to metric tons in this Order so the emissions may be viewed in context with the EPA's *Inventory of U.S. Greenhouse Gas Emissions and Sinks.*

(continued ...)

approximately 0.08 percent at the national level.[192] Currently, there are no national targets to use as benchmarks for comparison.[193]

138. The Final EIS included a qualitative discussion that addressed various effects of climate change.[194] The Final EIS acknowledges that the quantified GHG emissions from the construction and operation of the project will contribute incrementally to climate change.[195] Further, the Commission has previously concluded it could not determine a project's incremental physical impacts on the environment caused by GHG emissions.[196] The Commission has also previously concluded it could not determine whether a project's contribution to climate change would be significant.[197]

15. Cumulative Impacts

139. The final EIS considered the cumulative impacts of the projects with other projects or actions within the geographic and temporal scope of the projects.[198] The types of other projects evaluated in the final EIS that could potentially contribute to cumulative impacts on a range of environmental resources include existing LNG terminals and future liquefaction projects, oil and gas facilities, other industrial facilities, utility and transportation projects, commercial and residential developments, and government facilities/activities.[199] The final EIS concludes that the project's contribution to cumulative impacts on resources affected by the projects would not be significant, and

[192] EPA, *Inventory of U.S. Greenhouse Gas Emissions and Sinks 1990-2016* (2018), https://www.epa.gov/sites/production/files/2018-1/documents/2018_complete_report.pdf.

[193] The national emissions reduction targets expressed in the EPA's Clean Power Plan and the Paris climate accord are pending repeal and withdrawal, respectively.

[197] *Id.*

[198] Final EIS at 4-324.

[199] Final EIS at 5-25.

(continued ...)

that the potential cumulative impacts of the projects and the other projects considered would be minor or insignificant.[200]

16. Alternatives

140. The EIS assessed the No-Action Alternative, 20 new LNG or LNG terminal expansion system alternatives, 3 site alternatives, and various facility configuration alternatives for the Liquefaction Project that could achieve the Liquefaction Project's objectives. In addition, three pipeline route alternatives were considered. Alternatives were evaluated and compared to the projects to determine whether the alternatives were technically and economically feasible and practical; and offer a significant environmental advantage over the proposed projects. The final EIS concludes that the alternatives proposed did not offer a significant environmental advantage and found that the proposed projects, as modified by Commission staff's recommended mitigation measures, which are attached as conditions to the appendix to this order, was the preferred alternative.[201]

17. Environmental Analysis Conclusion

141. We have reviewed the information and analysis contained in the final EIS regarding potential environmental effects of the projects, as well as other information in the record. We are adopting the environmental recommendations in the final EIS and include them as conditions in the appendix to this order. Compliance with the environmental conditions appended to our orders is integral to ensuring that the environmental impacts of approved projects are consistent with those anticipated by our environmental analyses. Thus, Commission staff carefully reviews all information submitted. Commission staff will only issue a construction notice to proceed with an activity when satisfied that the applicant has complied with all applicable conditions. We also note that the Commission has the authority to take whatever steps are necessary to ensure the protection of environmental resources during construction and operation of the projects, including authority to impose any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the order, as well as the avoidance or mitigation of unforeseen adverse environmental impacts resulting from project construction and operation.

142. We agree with the conclusions presented in the final EIS and find that the projects, if constructed and operated as described in the final EIS, is an environmentally acceptable action. Further, for the reasons discussed throughout the order, as stated above, we find that the Liquefaction Project is not inconsistent with the public convenience and

[200] Final EIS at ES-9.

[201] Final EIS at ES-9 – ES-10.

necessity, and that the Louisiana Connector and Texas Connector projects are in the public convenience and necessity.

143. Any state or local permits issued with respect to the jurisdictional facilities authorized herein must be consistent with the conditions of this authorization and Certificate. The Commission encourages cooperation between jurisdictional companies and local authorities. However, this does not mean that state and local agencies, through application of state or local laws, may prohibit or unreasonably delay the construction or operation of facilities approved by this Commission.[202]

VI. Conclusion

144. At a hearing held on April 18, 2019, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application, and exhibits thereto, and all comments, and upon consideration of the record,

The Commission orders:

(A) In Docket No. CP17-20-000, Port Arthur LNG is authorized under section 3 of the NGA to site, construct, and operate the proposed project located in Port Arthur, Texas, as described and conditioned herein, and as fully described in Port Arthur LNG's application and subsequent filings, including any commitments made therein, and subject to the environmental conditions contained in the appendix of this order.

(B) Port Arthur LNG's proposed project shall be constructed and made available for service within five years of the date of this order.

(C) In Docket Nos. CP17-21-000, CP17-21-001, and CP18-7-000, a certificate of public convenience and necessity is issued to Port Arthur Pipeline authorizing it to construct and operate the Texas and Louisiana Connector projects, as described and conditioned herein, and as more fully described in the applications and subsequent filings by the application, including any commitments made therein.

---

[202] *See* 15 U.S.C. § 717r(d) (state or federal agency's failure to act on a permit considered to be inconsistent with Federal law); *see also Schneidewind v. ANR Pipeline Co.*, 485 U.S. 293, 310 (1988) (state regulation that interferes with FERC's regulatory authority over the transportation of natural gas is preempted) and *Dominion Transmission, Inc. v. Summers*, 723 F.3d 238, 245 (D.C. Cir. 2013) (noting that state and local regulation is preempted by the NGA to the extent it conflicts with federal regulation, or would delay the construction and operation of facilities approved by the Commission).

(D) The certificate authority issued in Ordering Paragraph (C) is conditioned on:

a. Port Arthur Pipeline's completing the authorized construction of the proposed facilities and making them available for service within five years of the date of this order pursuant to section 157.20(b) of the Commission's regulations;

b. Port Arthur Pipeline's compliance with all applicable Commission regulations, including, but not limited to, Parts 154, 157, and 284, and paragraphs (a), (c), (e), and (f) of section 157.20 of the Commission's regulations;

c. Port Arthur Pipeline's compliance with the environmental conditions in the appendix to this order, and

d. Port Arthur Pipeline filing a written statement affirming that it has executed firm contracts for the capacity levels and terms of service represented in signed precedent agreements, prior to commencing construction.

(E) A blanket construction certificate is issued to Port Arthur Pipeline under Subpart F of Part 157 of the Commission's regulations.

(F) A blanket transportation certificate is issued to Port Arthur Pipeline under Subpart G of Part 284 of the Commission's regulations.

(G) Port Arthur Pipeline's initial rates and tariff are approved, as conditioned and modified in this order.

(H) Port Arthur Pipeline shall file actual tariff records that comply with the requirements contained in the body of this order not less than 60 days prior to the commencement of interstate service consistent with Part 154 of the Commission's regulations.

(I) No later than three months after the end of its first three years of actual operation, as discussed herein, Port Arthur Pipeline must make a filing to justify its existing cost-based firm and interruptible recourse rates. Port Arthur Pipeline's cost and revenue study should be filed through the eTariff portal using a Type of Filing Code 580. In addition, Port Arthur Pipeline is advised to include as part of the eFiling description, a

reference to Docket Nos. CP17-21-000, CP17-21-001, and CP18-7-000, and to the cost and revenue study.[203]

(J) Port Arthur LNG and Port Arthur Pipeline shall notify the Commission's environmental staff by telephone, e-mail, and/or facsimile of any environmental noncompliance identified by other federal, state, or local agencies on the same day that such agency notifies Port Arthur LNG or Port Arthur Pipeline. Port Arthur LNG and Port Arthur Pipeline shall file written confirmation of such notification with the Secretary of the Commission within 24 hours.

By the Commission. Commissioner LaFleur is concurring with a separate statement attached.
Commissioner Glick is dissenting with a separate statement attached.

(S E A L)

Nathaniel J. Davis, Sr.,
Deputy Secretary.

Appendix A

Environmental Conditions

As recommended in the final environmental impact statement and otherwise amended herein, this authorization includes the following conditions:

1. Port Arthur LNG and Port Arthur Pipeline shall follow the construction procedures and mitigation measures described in its application and supplements (including responses to staff data requests) and as identified in the final environmental impact statement (EIS), unless modified by the Order. Port Arthur LNG and Port Arthur Pipeline must:

    a. request any modification to these procedures, measures, or conditions in a filing with the Secretary of the Commission (Secretary);

    b. justify each modification relative to site-specific conditions;

    c. explain how that modification provides an equal or greater level of environmental protection than the original measure; and

    d. receive approval in writing from the Director of the Office of Energy Projects (OEP) **before using that modification**.

2. For the Liquefaction Project, the Director of OEP, or the Director's designee, has delegated authority to address any requests for approvals or authorizations necessary to carry out the conditions of the Order, and take whatever steps are necessary to ensure the protection of life, health, property, and the environment during construction and operation of the project. This authority shall allow:

    a. the modification of conditions of the Order;

    b. stop-work authority and authority to cease operation; and

    c. the imposition of any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the Order as well as the avoidance or mitigation of unforeseen adverse environmental impact resulting from project construction and operation.

3. For the pipeline facilities, the Director of OEP, or the Director's designee, has delegated authority to address any requests for approvals or authorizations necessary to carry out the conditions of the Order, and take whatever steps are

necessary to ensure the protection of environmental resources during construction and operation of the projects. This authority shall allow:

a. the modification of conditions of the Order;

b. stop-work authority and authority to cease operation; and

c. the imposition of any additional measures deemed necessary to ensure continued compliance with the intent of the conditions of the Order as well as the avoidance or mitigation of unforeseen adverse environmental impact resulting from project construction and operation.

4. **Prior to any construction**, Port Arthur LNG and Port Arthur Pipeline shall file affirmative statements with the Secretary, certified by a senior company official, that all company personnel, Environmental Inspectors (EI), and contractor personnel will be informed of the EIs' authority and have been or will be trained on the implementation of the environmental mitigation measures appropriate to their jobs **before** becoming involved with construction and restoration activities.

5. The authorized facility locations shall be as shown in the EIS, as supplemented by filed alignment sheets. **As soon as they are available and before the start of construction**, Port Arthur LNG and Port Arthur Pipeline shall file with the Secretary any revised detailed survey alignment maps/sheets at a scale not smaller than 1:6,000 with station positions for all facilities approved by the Order. All requests for modifications of environmental conditions of the Order or site-specific clearances must be written and must reference locations designated on these alignment maps/sheets.

   Port Arthur Pipeline's exercise of eminent domain authority granted under Natural Gas Act (NGA) section 7(h) in any condemnation proceedings related to the Order must be consistent with these authorized facilities and locations. Port Arthur Pipeline's right of eminent domain granted under NGA section 7(h) does not authorize it to increase the size of its natural gas pipelines or facilities to accommodate future needs or to acquire a right-of-way for a pipeline to transport a commodity other than natural gas.

6. Port Arthur LNG and Port Arthur Pipeline shall file with the Secretary detailed alignment maps/sheets and aerial photographs at a scale not smaller than 1:6,000 identifying all route realignments or facility relocations; staging areas; pipe storage yards; new access roads; and other areas that will be used or disturbed and have not been previously identified in filings with the Secretary. Approval for each of these areas must be explicitly requested in writing. For each area, the request must include a description of the existing land use/cover type, documentation of landowner approval, whether any cultural resources or federally-listed threatened or

endangered species will be affected, and whether any other environmentally sensitive areas are within or abutting the area. All areas shall be clearly identified on the maps/sheets/aerial photographs. Each area must be approved in writing by the Director of OEP **before construction in or near that area**.

This requirement does not apply to extra workspace allowed by the Commission's *Upland Erosion Control, Revegetation & Maintenance Plan* and/or minor field realignments per landowner needs and requirements that do not affect other landowners or sensitive environmental areas such as wetlands.

Examples of alterations requiring approval include all route realignments and facility location changes resulting from:

a. implementation of cultural resources mitigation measures;

b. implementation of endangered, threatened, or special concern species mitigation measures;

c. recommendations by state regulatory authorities; and

d. agreements with individual landowners that affect other landowners or could affect sensitive environmental areas.

7. **Within 60 days of the acceptance of the authorization and before construction begins**, Port Arthur LNG and Port Arthur Pipeline shall each file Implementation Plans with the Secretary for review and written approval by the Director of OEP. Port Arthur LNG and Port Arthur Pipeline must file revisions to their plans as schedules change. The plans shall identify:

a. how Port Arthur LNG and Port Arthur Pipeline will implement the construction procedures and mitigation measures described in its application and supplements (including responses to staff data requests), identified in the EIS, and required by the Order;

b. how Port Arthur LNG and Port Arthur Pipeline will incorporate these requirements into the contract bid documents, construction contracts (especially penalty clauses and specifications), and construction drawings so that the mitigation required at each site is clear to on-site construction and inspection personnel;

c. the number of EIs assigned per spread and how Port Arthur LNG and Port Arthur Pipeline will ensure that sufficient personnel are available to implement the environmental mitigation;

d. the number of company personnel, including EIs and contractors, who will receive copies of the appropriate material;

e. the location and dates of the environmental compliance training and instructions Port Arthur LNG and Port Arthur Pipeline will give to all personnel involved with construction and restoration (initial and refresher training as the projects progress and personnel change), with the opportunity for OEP staff to participate in the training session(s);

f. the company personnel (if known) and specific portion of the Port Arthur LNG's and Port Arthur Pipeline's organization having responsibility for compliance;

g. the procedures (including use of contract penalties) Port Arthur LNG and Port Arthur Pipeline will follow if noncompliance occurs; and

h. for each discrete facility, a Gantt or PERT chart (or similar project scheduling diagram) and dates for:

i. the completion of all required surveys and reports;

ii. the environmental compliance training of on-site personnel;

iii. the start of construction; and

iv. the start and completion of restoration.

8. Port Arthur LNG and Port Arthur Pipeline shall employ a team of EIs, including at least one EI for the Liquefaction Project, and at least one EI per construction spread for the pipeline facilities. The EI(s) shall be:

a. responsible for monitoring and ensuring compliance with all mitigation measures required by the Order and other grants, permits, certificates, or other authorizing documents;

b. responsible for evaluating the construction contractor's implementation of the environmental mitigation measures required in the contract (see condition 7) and any other authorizing document;

c. empowered to order correction of acts that violate the environmental conditions of the Order, and any other authorizing document;

d. a full-time position, separate from all other activity inspectors;

e. responsible for documenting compliance with the environmental conditions of the Order, as well as any environmental conditions/permit requirements

imposed by other federal, state, or local agencies or the Coushatta Tribe of Louisiana for Tribal Trust Lands; and

f. responsible for maintaining status reports.

9. Beginning with the filing of their respective Implementation Plans, Port Arthur LNG and Port Arthur Pipeline shall each file updated status reports with the Secretary on a **monthly** basis for the Liquefaction Project and **weekly** basis for the Louisiana Connector and Texas Connector projects until all construction and restoration activities are complete. Problems of a significant magnitude shall be reported to the FERC **within 24 hours.** On request, these status reports will also be provided to other federal and state agencies with permitting responsibilities. Status reports shall include:

a. an update on Port Arthur LNG's and Port Arthur Pipeline's efforts to obtain the necessary federal authorizations;

b. the construction status of Liquefaction Facilities and each spread of the Louisiana Connector and Texas Connector projects, work planned for the following reporting period, and any schedule changes for stream crossings or work in other environmentally sensitive areas;

c. a listing of all problems encountered, contractor nonconformance/deficiency logs, and each instance of noncompliance observed by the EIs during the reporting period (both for the conditions imposed by the Commission and any environmental conditions/permit requirements imposed by other federal, state, or local agencies);

d. a description of the corrective and remedial actions implemented in response to all instances of noncompliance, nonconformance, or deficiency;

e. the effectiveness of all corrective and remedial actions implemented;

f. a description of any landowner/resident complaints that may relate to compliance with the requirements of the Order, and the measures taken to satisfy their concerns; and

g. copies of any correspondence received by Port Arthur LNG and Port Arthur Pipeline from other federal, state, local, or tribal permitting agencies concerning instances of noncompliance, and the Port Arthur LNG's and Port Arthur Pipeline's responses.

10. Port Arthur LNG and Port Arthur Pipeline must receive written authorization from the Director of OEP **before commencing construction of any project facilities**. To obtain such authorization, Port Arthur LNG and Port Arthur Pipeline shall file

with the Secretary documentation that it has received all applicable authorizations required under federal law (or evidence of waiver thereof).

11. Port Arthur LNG must receive written authorization from the Director of OEP **prior to introducing hazardous fluids into the liquefaction facilities**. Instrumentation and controls, hazard detection, hazard control, and security components/systems necessary for the safe introduction of such fluids shall be installed and functional.

12. Port Arthur LNG must receive written authorization from the Director of OEP **before placing the Liquefaction Project facilities into service**. Such authorization will only be granted following a determination that the facilities have been constructed in accordance with the FERC approval, can be expected to operate safely as designed, and the rehabilitation and restoration of the area affected by the Liquefaction Project facilities are proceeding satisfactorily.

13. Port Arthur Pipeline must receive written authorization from the Director of OEP **before placing the Texas Connector and/or the Louisiana Connector projects into service**. Such authorization will only be granted following a determination that the rehabilitation and restoration of the right-of-way and other areas affected by the Louisiana Connector and Texas Connector projects are proceeding satisfactorily.

14. **Within 30 days of placing the authorized facilities in service**, Port Arthur LNG and Port Arthur Pipeline shall file an affirmative statement with the Secretary, certified by a senior company official:

    a. that the facilities have been constructed in compliance with all applicable conditions, and that continuing activities will be consistent with all applicable conditions; or

    b. identifying which of the conditions in the Order Port Arthur LNG and Port Arthur Pipeline have complied with or will comply with. This statement shall also identify any areas affected by the projects where compliance measures were not properly implemented, if not previously identified in filed status reports, and the reason for noncompliance.

15. **Prior to construction of the projects**, Port Arthur LNG and Port Arthur Pipeline each shall file with the Secretary, for review and written approval by the Director of OEP, a project-specific plan for construction near known abandoned oil and gas wells. This plan shall identify actions to be taken if any unidentified oil or gas wells are discovered during construction and discuss how Port Arthur LNG or Port Arthur Pipeline will maintain the integrity of any plugged wells. (*section 4.1.2*)

16. **Prior to construction of the compressor stations associated with the Louisiana Connector and Texas Connector projects**, Port Arthur Pipeline shall file with the

Secretary the results of geotechnical studies for the compressor stations, including any recommended mitigation measures Port Arthur Pipeline will adopt as part of the final engineering design. (*section 4.1.3.1*)

17. **Prior to construction of the Liquefaction Project**, Port Arthur LNG shall provide the U.S. Environmental Protection Agency, U.S. Army Corps of Engineers (USACE), Texas Commission on Environmental Quality, and Texas Railroad Commission with the soil and sediment analysis conducted at the area within the ship canal at the marine berth, construction dock, material offloading facility, and landward component of the material offloading facility for review. Port Arthur LNG shall file the conclusions of the agency reviews with the Secretary along with documentation of its consultations with these agencies including any measures Port Arthur LNG will need to adopt if the analysis discovers previously unknown contamination. (*section 4.2.1.6*)

18. **Prior to construction of the Louisiana Connector and Texas Connector projects**, Port Arthur Pipeline shall file with the Secretary, for review and approval by the Director of OEP, the anticipated volume and source of water to be used for dust control. (*section 4.3.2.2*)

19. **Port Arthur LNG and Port Arthur Pipeline shall not begin construction of the projects until**:

    a. all outstanding biological surveys are completed;

    b. the FERC staff complete any necessary Endangered Species Act section 7 consultation, including conference for the eastern black rail, with the U.S. Fish and Wildlife Service;

    c. Port Arthur LNG and Port Arthur Pipeline have received written notification from the Director of OEP that construction and/or use of mitigation (including implementation of conservation measures) may begin. (*section 4.7.3*)

20. **Prior to construction of the Louisiana Connector Project**, Port Arthur Pipeline shall conduct surveys for the American chaffseed on the remaining no-access parcels with potential habitat. If the American chaffseed is found, Port Arthur Pipeline shall incorporate methods to avoid impacts on the American chaffseed. Port Arthur Pipeline shall file with the Secretary and the U.S. Fish and Wildlife Service (Louisiana office) both the survey results and Port Arthur Pipeline's proposed avoidance methods. (*section 4.7.3.5*)

21. **Prior to construction of the Liquefaction Project**, Port Arthur LNG shall file with the Secretary documentation of concurrence from the USACE and Texas General

Land Office that the Liquefaction Project is consistent with the Coastal Zone Management Act. (*section 4.8.9.1*)

22. **Prior to construction of the Louisiana Connector and Texas Connector projects**, Port Arthur Pipeline shall file with the Secretary documentation of concurrence from the USACE, Texas General Land Office, and Louisiana Office of Coastal Management that the Texas Connector Project and Louisiana Connector Project are consistent with the Coastal Zone Management Act. (*section 4.8.9.2*)

23. **Prior to construction of the Liquefaction Project,** Port Arthur LNG shall file with the Secretary its Transportation Plan for the Liquefaction Project, for review and written approval by the Director of OEP. The plan shall include personnel training; permitting requirements; consultations conducted with local and state agencies; and how access to/from the work site by personnel, equipment, and materials will be managed on a daily basis throughout construction. (*section 4.9.6.1*)

24. **Prior to construction of the Louisiana Connector Project in Louisiana**, Port Arthur Pipeline shall file with the Secretary, for review and written approval by the Director of OEP, a revised *Unanticipated Discoveries Plan* that clarifies that Tribal Historic Preservation Office construction recommencement authorization is only applicable to Coushatta Tribe of Louisiana tribal trust lands. (*section 4.10.2*)

25. Port Arthur LNG and Port Arthur Pipeline shall **not begin** construction of facilities and/or use of staging, storage, or temporary work areas and new or to-be-improved access roads **associated with the projects until**:

    a. Port Arthur LNG files with the Secretary, the outstanding information for Dredge Disposal Area 8, and the Texas State Historic Preservation Office's (SHPO) comments on the information;

    b. Port Arthur LNG files any required survey report for Dredge Disposal Area 8, and the Texas SHPO's comments on the report;

    c. Port Arthur Pipeline files with the Secretary all outstanding survey reports, evaluation reports, special studies, and any required avoidance/treatment plans, and the Texas and Louisiana SHPOs' and the Coushatta Tribe of Louisiana Tribal Historic Preservation Office's comments (as applicable) on these;

    d. the Advisory Council on Historic Preservation is afforded an opportunity to comment if historic properties will be adversely affected; and

    e. the FERC staff reviews and the Director of OEP approves the cultural resources reports, studies, and plans, and notifies Port Arthur LNG and Port Arthur Pipeline in writing that treatment plans/mitigation measures

(including archaeological data recovery) may be implemented and/or construction may proceed.

All materials filed with the Commission containing **location, character, and ownership information** about cultural resources must have the cover and any relevant pages therein clearly labeled in bold lettering "**CUI//PRIV – DO NOT RELEASE**."(*sections 4.10.4.1. and 4.10.4.2*)

26. **Prior to construction of horizontal directional drills (HDD) at mileposts (MP) 19.6 and 20.3 along the Texas Connector Project's Northern Pipeline; MP 0.5 along the GTS Lateral; MP 0.8 along the FGT Lateral; and MPs 38.7, 40.5, 42.5, 47.9, 48.5, 56.8, 60.2, 79.4, 91.1, 96.9, 110.1, and 110.3 along the Louisiana Connector Project** where HDD-related noise could exceed the Commission's sound level criterion at the closest noise-sensitive area (NSA), Port Arthur Pipeline shall file with the Secretary, for review and written approval by the Director of OEP, an HDD noise mitigation plan to reduce the projected noise level attributable to the proposed drilling operations at nearby NSAs. During drilling operations, Port Arthur Pipeline shall implement the approved plan, monitor noise levels, and make all reasonable efforts to restrict the noise attributable to the drilling operations to no more than a day-night sound level (L_{dn}) of 55 decibels on the A-weighted scale (dBA) at the NSAs or 10 dBA above background where nighttime ambient noise is above 55 dBA L_{dn}. (*section 4.11.2.3*)

27. Port Arthur LNG shall file a full power load noise survey with the Secretary **no later than 60 days** after placing each Liquefaction Project train in service. If the noise attributable to the operation of the equipment at the liquefaction facilities exceeds 55 dBA L_{dn} at the nearest NSA, **within 60 days** Port Arthur LNG shall modify operation of the liquefaction facilities or install additional noise controls until a noise level below 55 dBA L_{dn} at the NSA is achieved. Port Arthur LNG shall confirm compliance with the above requirement by filing a second noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls. (*section 4.11.2.4*)

28. Port Arthur LNG and Port Arthur Pipeline shall file noise surveys with the Secretary **no later than 60 days** after placing the entire Liquefaction Project facility, including the South Compressor Station associated with the Texas Connector Project, into service. If a full load condition noise survey is not possible, Port Arthur LNG and Port Arthur Pipeline shall provide an interim survey at the maximum possible horsepower load **within 60 days** of placing the Liquefaction Project facility and South Compressor Station into service and provide the full load survey **within 6 months**. If the noise attributable to operation of the equipment at the Liquefaction Project facility and South Compressor Station exceeds 55 dBA L_{dn} at the nearest NSA under interim or full horsepower load conditions, Port Arthur LNG and Port Arthur Pipeline shall file a report on what changes are needed and shall install the

additional noise controls to meet the level **within 1 year** of the in-service date. Port Arthur LNG and Port Arthur Pipeline shall confirm compliance with the above requirement by filing an additional noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls. (*section 4.11.2.4*)

29. Port Arthur Pipeline shall file a noise survey with the Secretary **no later than 60 days** after placing the Texas Connector Project North Compressor Station and Louisiana Connector Project's compressor station in service. If a full load condition noise survey is not possible, Port Arthur Pipeline shall instead file an interim survey at the maximum possible horsepower load and file the full load survey **within 6 months**. If the noise attributable to the operation of all of the equipment at any station under interim or full horsepower load exceeds 55 dBA L_{dn} at any nearby NSA, Port Arthur Pipeline shall file a report on what changes are needed and shall install the additional noise controls to meet the level **within 1 year** of the in-service date. Port Arthur Pipeline shall confirm compliance with the 55 dBA L_{dn} requirement by filing a second noise survey with the Secretary **no later than 60 days** after it installs the additional noise controls. (*section 4.11.2.4*)

30. **Prior to construction of final design,** Port Arthur LNG shall file with the Secretary the following information, stamped and sealed by the professional engineer-of-record, registered in Texas:

    a. site preparation drawings and specifications;

    b. LNG terminal structures and foundation design drawings and calculations (including prefabricated and field constructed structures);

    c. seismic specifications for procured equipment; and

    d. quality control procedures to be used for civil/structural design and construction.

    In addition, Port Arthur LNG shall file, in its Implementation Plan, the schedule for producing this information. *(section 4.12.6)*

31. **Prior to commencement of service,** Port Arthur LNG shall file with the Secretary a monitoring and maintenance plan, stamped and sealed by the professional engineer-of-record registered in Texas, for the perimeter levee which ensures the crest elevation relative to mean sea level will be maintained for the life of the facility considering berm settlement, subsidence, and sea level rise. *(section 4.12.6)*

Conditions 32 through 126 shall apply to the Port Arthur Liquefaction Project. Information pertaining to these specific conditions below shall be filed with the Secretary for review and written approval by the Director of OEP, or the Director's designee, within the timeframe indicated by each condition. Specific engineering, vulnerability, or

detailed design information meeting the criteria specified in Order No. 833 (Docket No. RM16-15-000), including security information, shall be submitted as critical energy infrastructure information pursuant to 18 C.F.R. 388.113. See *Critical Electric Infrastructure Security and Amending Critical Energy Infrastructure Information*, Order No. 833, 81 Fed. Reg. 93,732 (December 21, 2016), FERC Stats. & Regs. 31,389 (2016). Information pertaining to items such as offsite emergency response, procedures for public notification and evacuation, and construction and operating reporting requirements will be subject to public disclosure. All information shall be filed **a minimum of 30 days** before approval to proceed is requested.

32. **Prior to initial site preparation,** Port Arthur LNG shall file an overall project schedule, which includes the proposed stages of the commissioning plan. *(section 4.12.6)*

33. **Prior to initial site preparation,** Port Arthur LNG shall file quality assurance and quality control procedures for construction activities. *(section 4.12.6)*

34. **Prior to initial site preparation,** Port Arthur LNG shall file procedures for controlling access during construction. *(section 4.12.6)*

35. **Prior to initial site preparation,** Port Arthur LNG shall develop an emergency response plan (ERP) (including evacuation) and coordinate procedures with the U.S. Coast Guard; state, county, and local emergency planning groups; fire departments; state and local law enforcement; and appropriate federal agencies. This plan shall include at a minimum:

    a. designated contacts with state and local emergency response agencies;

    b. scalable procedures for the prompt notification of appropriate local officials and emergency response agencies based on the level and severity of potential incidents;

    c. procedures for notifying residents and recreational users within areas of potential hazard;

    d. evacuation routes/methods for residents and public use areas that are within any transient hazard areas along the route of the LNG marine transit;

    e. locations of permanent sirens and other warning devices; and

    f. an “emergency coordinator” on each LNG carrier to activate sirens and other warning devices.

Port Arthur LNG shall notify the FERC staff of all planning meetings in advance and shall report progress on the development of its ERP at **3-month intervals**. *(section 4.12.6)*

36. **Prior to initial site preparation,** Port Arthur LNG shall file a Cost-Sharing Plan identifying the mechanisms for funding all Project-specific security/emergency management costs that will be imposed on state and local agencies. This comprehensive plan shall include funding mechanisms for the capital costs associated with any necessary security/emergency management equipment and personnel base. Port Arthur LNG shall notify FERC staff of all planning meetings in advance and shall report progress on the development of its Cost Sharing Plan at **3-month intervals**. *(section 4.12.6)*

37. **Prior to construction of final design,** Port Arthur LNG shall file change logs that list and explain any changes made from the front-end-engineering-design (FEED) provided in Port Arthur LNG's application and filings. A list of all changes with an explanation for the design alteration shall be filed and all changes shall be clearly indicated on all diagrams and drawings. *(section 4.12.6)*

38. **Prior to construction of final design,** Port Arthur LNG shall file information/revisions pertaining to Port Arthur LNG' response numbers 9, 11, 18, 19, 24, 28, 29, 30-33, 34, 36-41, 43-46, 54-55 of its January 29, 2018 filing and 52 and 57 of its February 7, 2018 filing, which indicated features to be included or considered in the final design. *(section 4.12.6)*

39. **Prior to construction of final design,** Port Arthur LNG shall file a plot plan of the final design showing all major equipment, structures, buildings, and impoundment systems. *(section 4.12.6)*

40. **Prior to construction of final design,** Port Arthur LNG shall file three-dimensional plant drawings to confirm plant layout for maintenance, access, egress, and congestion. *(section 4.12.6)*

41. **Prior to construction of final design,** Port Arthur LNG shall file drawings of the storage tank piping support structure and support of horizontal piping at grade including pump columns, relief valves, pipe penetrations, instrumentation, and appurtenances. *(section 4.12.6)*

42. **Prior to construction of final design,** Port Arthur LNG shall file a complete specification and drawings of the proposed LNG tank design and installation. *(section 4.12.6)*

43. **Prior to construction of final design,** Port Arthur LNG shall file an up-to-date equipment list, process and mechanical data sheets, and specifications. The specifications shall include:

    a. building specifications (control buildings, electrical buildings, compressor buildings, storage buildings, pressurized buildings, ventilated buildings, blast resistant buildings);

    b. mechanical specifications (piping, valve, insulation, rotating equipment, heat exchanger, storage tank and vessel, other specialized equipment);

    c. electrical and instrumentation specifications (power system specifications, control system specifications, Safety Instrumented Systems (SIS) specifications, cable specifications, other electrical and instrumentation specifications); and

    d. security and fire safety specifications (security, passive protection, hazard detection, hazard control, firewater). *(section 4.12.6)*

44. **Prior to construction of final design,** Port Arthur LNG shall file a list of all codes and standards and the final specification document number where they are referenced. *(section 4.12.6)*

45. **Prior to construction of final design,** Port Arthur LNG shall file up-to-date process flow diagrams (PFDs) and piping and instrument diagrams (P&IDs), including vendor P&IDs. The PFDs shall include heat and material balances. The P&IDs shall include the following information:

    a. equipment tag number, name, size, duty, capacity, and design conditions;

    b. equipment insulation type and thickness;

    c. storage tank pipe penetration size and nozzle schedule;

    d. valve high pressure side and internal and external vent locations;

    e. piping with line number, piping class specification, size, and insulation type and thickness;

    f. piping specification breaks and insulation limits;

    g. all control and manual valves numbered;

    h. relief valves with size and set points; and

    i. drawing revision number and date. *(section 4.12.6)*

46. **Prior to construction of final design,** Port Arthur LNG shall file P&IDs, specifications, and procedures that clearly show and specify the tie-in details required to safely connect subsequently constructed facilities with the operational facilities. *(section 4.12.6)*

47. **Prior to construction of final design,** Port Arthur LNG shall file a car seal philosophy and a list of all car-sealed and locked valves consistent with the P&IDs. *(section 4.12.6)*

48. **Prior to construction of final design,** the engineering, procurement, and construction contractor shall verify that the recommendations from the FEED Hazard Identification are complete and consistent with the requirements of the final design as determined by the engineering, procurement, and construction contractor. *(section 4.12.6)*

49. **Prior to construction of final design,** Port Arthur LNG shall file a hazard and operability review review prior to issuing the P&IDs for construction. A copy of the review, a list of the recommendations, and actions taken on the recommendations shall be filed. *(section 4.12.6)*

50. **Prior to construction of final design,** Port Arthur LNG shall file the safe operating limits (upper and lower), alarm and shutdown set points for all instrumentation (i.e., temperature, pressures, flows, and compositions). *(section 4.12.6)*

51. **Prior to construction of final design,** Port Arthur LNG shall file cause-and-effect matrices for the process instrumentation, fire and gas detection system, and emergency shutdown (ESD) system for review and approval. The cause-and-effect matrices shall include alarms and shutdown functions, details of the voting and shutdown logic, and set points. *(section 4.12.6)*

52. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation of ESD valve closure times. The evaluation shall account for the time to detect an upset or hazardous condition, notify plant personnel, and close the ESD valve. *(section 4.12.6)*

53. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation of dynamic pressure surge effects from valve opening and closure times and pump operations. *(section 4.12.6)*

54. **Prior to construction of final design,** Port Arthur LNG shall demonstrate that hazardous fluid piping and piping nipples 2 inches or less in diameter are designed to withstand external loads, including vibrational loads in the vicinity of rotating equipment and operator live loads in areas accessible by operators. *(section 4.12.6)*

55. **Prior to construction of final design,** Port Arthur LNG shall specify that all drains from high pressure hazardous fluid systems are equipped with double isolation and bleed valves. *(section 4.12.6)*

56. **Prior to construction of final design,** Port Arthur LNG shall file electrical area classification drawings. *(section 4.12.6)*

57. **Prior to construction of final design,** Port Arthur LNG shall file drawings and details of how process seals or isolations installed at the interface between a flammable fluid system and an electrical conduit or wiring system meet the requirements of National Fire Protection Association (NFPA) 59A (2001). *(section 4.12.6)*

58. **Prior to construction of final design,** Port Arthur LNG shall file details of an air gap or vent installed downstream of process seals or isolations installed at the interface between a flammable fluid system and an electrical conduit or wiring system. Each air gap shall vent to a safe location and be equipped with a leak detection device that shall continuously monitor for the presence of a flammable fluid, alarm the hazardous condition, and shut down the appropriate systems. *(section 4.12.6)*

59. **Prior to construction of final design,** Port Arthur LNG shall include layout and design specifications of the pig trap, inlet separation and liquid disposal, inlet/send-out meter station, and pressure control. *(section 4.12.6)*

60. **Prior to construction of final design,** Port Arthur LNG shall specify that piping and equipment that may be cooled with liquid nitrogen will be designed for liquid nitrogen temperatures, with regard to allowable movement and stresses. *(section 4.12.6)*

61. **Prior to construction of final design,** Port Arthur LNG shall include LNG tank fill flow measurement with high flow alarm. *(section 4.12.6)*

62. **Prior to construction of final design,** Port Arthur LNG shall include boil-off gas flow, tank density profile, and temperature profile measurement for each tank. *(section 4.12.6)*

63. **Prior to construction of final design,** Port Arthur LNG shall file the structural analysis of the LNG storage tank and outer concrete impoundment wall to demonstrate they are designed to withstand all loads and combinations. *(section 4.12.6)*

64. **Prior to construction of final design,** Port Arthur LNG shall file an analysis of the structural integrity of the outer containment of the full containment storage tanks when exposed to a roof tank top fire or adjacent tank top fire. *(section 4.12.6)*

65. **Prior to construction of final design,** Port Arthur LNG shall file the sizing basis and capacity for the final design of the flares and/or vent stacks as well as the pressure and vacuum relief valves for major process equipment, vessels, and storage tanks. *(section 4.12.6)*

66. **Prior to construction of final design,** Port Arthur LNG shall file detailed cooldown plans showing the piping flow, valve alignment, and instruments used to monitor the initial cooldown and filling of the LNG storage tanks. *(section 4.12.6)*

67. **Prior to construction of final design,** Port Arthur LNG shall file detailed procedures for import of LNG during the initial cooldown of the LNG storage tanks including detailed P&IDs with flow paths and valve alignment showing the position of valves and lockout/tagout devices. *(section 4.12.6)*

68. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation on the need to install fixed toxic gas detection to detect hydrogen sulfide (H_2S) releases from loss of containment from the acid gas piping system and potential release points (i.e., vents, relief valves, vent stacks, and thermal oxidizer stack). *(section 4.12.6)*

69. **Prior to construction of final design,** Port Arthur LNG shall file process simulation results for the deethanizer, depropanizer depressurized conditions to ensure the associated deethanizer, depropanizer, reboiler, piping, and other associated equipment are adequately designed for settle out and upset conditions to prevent brittle facture of piping and associated equipment. *(section 4.12.6)*

70. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation assessing the minimum design metal temperature and material of construction needed for the deethanizer, depropanizer, reboiler and piping during upset/settleout conditions. *(section 4.12.6)*

71. **Prior to construction of final design**, Port Arthur LNG shall include provisions to maintain stability and pressure of the regenerator in the event that the H_2S scavenger or thermal oxidizer are unavailable (e.g., change out, maintenance, startup, etc.). *(section 4.12.6)*

72. **Prior to construction of final design,** Port Arthur LNG shall include a thermal relief valve between the propane shutoff valves (XV-30687 and XV0-30686) to protect piping. *(section 4.12.6)*

73. **Prior to construction of final design,** Port Arthur LNG shall include a thermal relief valve between the ethane shutoff valves (XV0-30729 and XV0-30731) to protect piping. *(section 4.12.6)*

74. **Prior to construction of final design,** Port Arthur LNG shall include provisions to prevent cryogenic fluids accumulated in the dry flare knockout drum from reaching the wet flare knockout drum, which are connected by the dry flare knockout drum drain line to the blow case purge to the wet flare knockout drum. *(section 4.12.6)*

75. **Prior to construction of final design**, Port Arthur LNG shall include details of the flare knockout drum heater and detailed procedures for draining flare knockout drums to a safe location. *(section 4.12.6)*

76. **Prior to construction of final design,** Port Arthur LNG shall file detailed calculations for the flow rate of the jockey pumps accounting for flow rate losses due to leaks or when drain valves are opened to ensure that system losses do not exceed the specified design flow rate of the jockey firewater pumps. *(section 4.12.6)*

77. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation of the need to install pressure relieving protection for flammable liquid piping segments (i.e., refrigerants, liquid hydrocarbons, condensate products) that can be isolated by valves. *(section 4.12.6)*

78. **Prior to construction of final design,** Port Arthur LNG shall specify that all ESD valves will be equipped with open and closed position switches connected to the Distributed Control System (DCS)/SIS. *(section 4.12.6)*

79. **Prior to construction of final design,** Port Arthur LNG shall file a drawing showing the location of the ESD buttons. Emergency shutdown buttons shall be easily accessible, conspicuously labeled, and located in an area which will be accessible during an emergency. *(section 4.12.6)*

80. **Prior to construction of final design,** Port Arthur LNG shall file drawings and specifications for vehicle barriers at each facility entrance for access control. *(section 4.12.6)*

81. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation of the need to install turning lanes to minimize the risk of hazardous material truck and other vehicle incidents entering and exiting the facility from State Highway 87. *(section 4.12.6)*

82. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation of the need for installing internal road vehicle protections (e.g., guard rails, barriers, and bollards) to protect transfer piping, pumps, and compressors, etc. and to ensure that they are located away from roadway or protected from inadvertent damage from vehicles. *(section 4.12.6)*

83. **Prior to construction of final design,** Port Arthur LNG shall file a projectile analysis for review and approval to demonstrate that the outer concrete

impoundment wall of a full-containment LNG tank could withstand windborne projectiles. The analysis shall detail the projectile speeds and characteristics and method used to determine penetration or perforation depths. *(section 4.12.6)*

84. **Prior to construction of final design,** Port Arthur LNG shall file security camera, intrusion detection, and lighting drawings. The security camera drawings shall show the location, areas covered, and features of the camera (fixed, tilt/pan/zoom, motion detection alerts, low light, mounting height, etc.) to verify camera coverage of the entire perimeter with redundancies for cameras interior to the facility to enable rapid monitoring of the LNG plant. The intrusion detection drawings shall show or note the location of the intrusion detection to verify it covers the entire perimeter of the LNG plant. The lighting drawings shall show the location, elevation, type of light fixture, and lux levels of the lighting system. *(section 4.12.6)*

85. **Prior to construction of final design,** Port Arthur LNG shall file the details of the ESD system, including whether a plant-wide ESD button with proper sequencing and reliability will be installed or whether another system will be installed that is demonstrated through a human reliability analysis to provide a means to quickly and reliably shutdown the entire plant. *(section 4.12.6)*

86. **Prior to construction of final design,** Port Arthur LNG shall file an updated fire protection evaluation of the proposed facilities. A copy of the evaluation, a list of recommendations and supporting justifications, and actions taken on the recommendations shall be filed. *(section 4.12.6)*

87. **Prior to construction of final design,** Port Arthur LNG shall file spill containment system drawings with dimensions and slopes of curbing, trenches, impoundments, and capacity calculations considering any foundations and equipment within impoundments, as well as the sizing and design of the down-comer that will transfer spills from the tank top to the ground-level impoundment system. The spill containment drawings shall show containment for all hazardous fluids from the largest flow from a single line for 10 minutes or from the largest vessel or otherwise demonstrate spill containment will not significantly reduce the flammable vapor dispersion or radiant heat consequences of a spill. *(section 4.12.6)*

88. **Prior to construction of final design**, Port Arthur LNG shall specify the material of construction for the curbed areas, trenches, and impoundments as insulated concrete or otherwise demonstrate insulated concrete will not significantly reduce the flammable vapor dispersion or radiant heat consequences of a spill. *(section 4.12.6)*

89. **Prior to construction of final design,** Port Arthur LNG shall file an analysis of the localized hazards to operators from a potential liquid nitrogen release and shall also

provide spill containment and low oxygen detectors to mitigate liquid nitrogen releases. *(section 4.12.6)*

90. **Prior to construction of final design,** Port Arthur LNG shall file complete drawings and a list of the hazard detection equipment. The drawings shall clearly show the location and elevation of all detection equipment and demonstrate potential releases resulting in an offsite impact could be detected by at least two detectors to allow for shutdown in less than 10 minutes. The list shall include the instrument tag number, type and location, alarm indication locations, and shutdown functions of the hazard detection equipment. *(section 4.12.6)*

91. **Prior to construction of final design,** Port Arthur LNG shall file a list of alarm and shutdown set points for all hazard detectors that account for the calibration gas of the hazard detectors when determining the lower flammable limit set points for methane, propane, butane, ethane, and condensate. *(section 4.12.6)*

92. **Prior to construction of final design,** Port Arthur LNG shall file a list of alarm and shutdown set points for all hazard detectors that account for the calibration gas of hazard detectors when determining the set points for toxic components such as aqueous ammonia, natural gas liquids and H_2S. *(section 4.12.6)*

93. **Prior to construction of final design,** Port Arthur LNG shall file a technical review of facility design that:

    a. identifies all combustion/ventilation air intake equipment and the distances to any possible flammable gas or toxic release; and

    b. demonstrates that these areas are adequately covered by hazard detection devices and indicates how these devices will isolate or shutdown any combustion or heating ventilation and air conditioning equipment whose continued operation could add to or sustain an emergency. *(section 4.12.6)*

94. **Prior to construction of the final design,** Port Arthur LNG shall file a building siting assessment to ensure plant buildings that are occupied or critical to the safety of the LNG plant are adequately protected from potential hazards involving fires and vapor cloud explosions. *(section 4.12.6)*

95. **Prior to construction of final design,** Port Arthur LNG shall file a drawing that includes smoke detection in occupied buildings. *(section 4.12.6)*

96. **Prior to construction of final design,** Port Arthur LNG shall file a drawing that includes hazard detection suitable to detect high temperatures and smoldering combustion products in electrical buildings and control room buildings. *(section 4.12.6)*

97. **Prior to construction of final design,** Port Arthur LNG shall file a drawing that includes clean agent systems in the electrical switchgear and instrumentation buildings. *(section 4.12.6)*

98. **Prior to construction of final design,** Port Arthur LNG shall file facility plan drawings and a list of the fixed and wheeled dry-chemical, hand-held fire extinguishers, and other hazard control equipment. Plan drawings shall clearly show the location by tag number and elevation of all fixed, wheeled, and hand-held extinguishers and demonstrate travel distances are along normal paths of access and egress and in compliance with NFPA 10, 15, and 17. The list shall include the equipment tag number, type, capacity, equipment covered, discharge rate, and automatic and manual remote signals initiating discharge of the units. *(section 4.12.6)*

99. **Prior to construction of final design,** Port Arthur LNG shall file facility plan drawings showing the proposed location of the firewater and any foam systems. Plan drawings shall clearly show the location of firewater and foam piping, post indicator valves, and the location and area covered by, each monitor, hydrant, hose, water curtain, deluge system, foam system, water-mist system, and sprinkler. The drawings shall demonstrate that each process area, fire zone, or other sections of piping with several users can be isolated with post indicator valves and that firewater coverage is provided by at least two monitors or hydrants with sufficient firewater flow to cool exposed surfaces subjected to a fire. Drawings shall also include piping and instrumentation diagrams of the firewater and foam systems. *(section 4.12.6)*

100. **Prior to construction of final design,** Port Arthur LNG shall file detailed calculations to confirm that the final fire water volumes will be accounted for when evaluating the capacity of the impoundment system during a spill and fire scenario. *(section 4.12.6)*

101. **Prior to construction of final design,** Port Arthur LNG shall specify that the firewater flow test meter is equipped with a transmitter and that a pressure transmitter is installed upstream of the flow transmitter. The flow transmitter and pressure transmitter shall be connected to the DCS and recorded. *(section 4.12.6)*

102. **Prior to construction of final design,** Port Arthur LNG shall specify that the firewater pump shelter is designed with a removable roof for maintenance access to the firewater pumps. *(section 4.12.6)*

103. **Prior to construction of final design,** Port Arthur LNG shall file calculations for the firewater spray systems sized to provide cooling for mitigation of boiling-liquid-expanding-vapor explosions. *(section 4.12.6)*

104. **Prior to construction of final design,** Port Arthur LNG shall file a design that accounts for the fire water required for foam generation in calculating the total fire water required for 2 hours of supply. *(section 4.12.6)*

105. **Prior to construction of final design,** Port Arthur LNG shall file drawings and specifications for the structural passive protection systems to protect equipment and supports from cryogenic releases. *(section 4.12.6)*

106. **Prior to construction of final design,** Port Arthur LNG shall file a detailed quantitative analysis to demonstrate that adequate thermal mitigation will be provided for each significant component within the 4,000 BTU/ft^2-hr zone from an impoundment, or provide an analysis that evaluates the consequences of pressure vessel bursts and boiling liquid expanding vapor explosions. Trucks at the truck transfer station shall be included in the analysis. Passive mitigation shall be supported by calculations for the thickness limiting temperature rise and active mitigation shall be justified with calculations demonstrating flow rates and durations of any cooling water to mitigate the heat absorbed by the vessel. *(section 4.12.6)*

107. **Prior to construction of final design,** Port Arthur LNG shall file an evaluation of the voting logic and voting degradation for hazard detectors. *(section 4.12.6)*

108. **Prior to commissioning,** Port Arthur LNG shall file a detailed schedule for commissioning through equipment startup. The schedule shall include milestones for all procedures and tests to be completed: prior to introduction of hazardous fluids and during commissioning and startup. Port Arthur LNG shall file documentation certifying that each of these milestones has been completed before authorization to commence the next phase of commissioning and startup will be issued. *(section 4.12.6)*

109. **Prior to commissioning,** Port Arthur LNG shall file detailed plans and procedures for: testing the integrity of onsite mechanical installation; functional tests; introduction of hazardous fluids; operational tests; and placing the equipment into service. *(section 4.12.6)*

110. **Prior to commissioning,** Port Arthur LNG shall file a plan for clean-out, dry-out, purging, and tightness testing. This plan shall address the requirements of the American Gas Association's Purging Principles and Practice, and shall provide justification if not using an inert or non-flammable gas for clean-out, dry-out, purging, and tightness testing. *(section 4.12.6)*

111. **Prior to commissioning,** Port Arthur LNG shall file the procedures for pressure/leak tests which address the requirements of American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code section VIII, and

ASME B31.3. The procedures shall include a line list of pneumatic and hydrostatic test pressures. *(section 4.12.6)*

112. **Prior to commissioning,** Port Arthur LNG shall file the operation and maintenance procedures and manuals, as well as safety procedures, hot work procedures and permits, abnormal operating conditions reporting procedures, simultaneous operations procedures, and management of change procedures and forms. *(section 4.12.6)*

113. **Prior to commissioning,** Port Arthur LNG shall tag all equipment, instrumentation, and valves in the field, including drain valves, vent valves, main valves, and car-sealed or locked valves. *(section 4.12.6)*

114. **Prior to commissioning,** Port Arthur LNG shall file a plan to maintain a detailed training log to demonstrate that operating staff has completed the required training. *(section 4.12.6)*

115. **Prior to commissioning,** Port Arthur LNG shall equip the LNG storage tank and adjacent piping and supports with permanent settlement monitors to allow personnel to observe and record the relative settlement between the LNG storage tank and adjacent piping. The settlement record shall be reported in the **semi-annual** operational reports. *(section 4.12.6)*

116. **Prior to introduction of hazardous fluids,** Port Arthur LNG shall develop and implement an alarm management program to reduce alarm complacency and maximize the effectiveness of operator response to alarms. *(section 4.12.6)*

117. **Prior to introduction of hazardous fluids**, Port Arthur LNG shall file results of the LNG storage tank hydrostatic test and foundation settlement results. At a minimum, foundation settlement results shall be provided thereafter **annually.** *(section 4.12.6)*

118. **Prior to introduction of hazardous fluids,** Port Arthur LNG shall complete and document all pertinent tests (Factory Acceptance Tests, Site Acceptance Tests, Site Integration Tests) associated with the DCS and SIS that demonstrates full functionality and operability of the system. *(section 4.12.6)*

119. **Prior to introduction of hazardous fluids,** Port Arthur LNG shall complete and document a firewater pump acceptance test and firewater monitor and hydrant coverage test. The actual coverage area from each monitor and hydrant shall be shown on facility plot plan(s). *(section 4.12.6)*

120. **Prior to introduction of hazardous fluids,** Port Arthur LNG shall complete and document a pre-startup safety review to ensure that installed equipment meets the design and operating intent of the facility. The pre-startup safety review shall

include any changes since the last hazard review, operating procedures, and operator training. A copy of the review with a list of recommendations, and actions taken on each recommendation, shall be filed. *(section 4.12.6)*

121. **Port Arthur LNG shall file a request for written authorization from the Director of OEP prior to unloading or loading the first LNG commissioning cargo**. **After production of first LNG**, Port Arthur LNG shall file **weekly** reports on the commissioning of the proposed systems that detail the progress toward demonstrating the facilities can safely and reliably operate at or near the design production rate. The reports shall include a summary of activities, problems encountered, and remedial actions taken. The weekly reports shall also include the latest commissioning schedule, including projected and actual LNG production by each liquefaction train, LNG storage inventories in each storage tank, and the number of anticipated and actual LNG commissioning cargoes, along with the associated volumes loaded or unloaded. Further, the weekly reports shall include a status and list of all planned and completed safety and reliability tests, work authorizations, and punch list items. Problems of significant magnitude shall be reported to the FERC **within 24 hours**. *(section 4.12.6)*

122. **Prior to commencement of service,** Port Arthur LNG shall label piping with fluid service and direction of flow in the field, in addition to the pipe labeling requirements of NFPA 59A (2001). *(section 4.12.6)*

123. **Prior to commencement of service,** Port Arthur LNG shall provide plans for any preventative and predictive maintenance program that performs periodic or continuous equipment condition monitoring. *(section 4.12.6)*

124. **Prior to commencement of service,** Port Arthur LNG shall develop procedures for offsite contractors' responsibilities, restrictions, and limitations and for supervision of these contractors by Port Arthur LNG staff. *(section 4.12.6)*

125. **Prior to commencement of service,** Port Arthur LNG shall notify the FERC staff of any proposed revisions to the security plan and physical security of the plant. *(section 4.12.6)*

126. **Prior to commencement of service,** Port Arthur LNG shall file a request for written authorization from the Director of OEP. Such authorization will only be granted following a determination by the U.S. Coast Guard, under its authorities under the Ports and Waterways Safety Act, the Magnuson Act, the Maritime Transportation Security Act of 2002, and the Security and Accountability For Every Port Act, that appropriate measures to ensure the safety and security of the facility and the waterway have been put into place by Port Arthur LNG or other appropriate parties. *(section 4.12.6)*

In addition, recommendations 127 through 130 shall apply **throughout the life of the Port Arthur Liquefaction facility**.

127. The facility shall be subject to regular FERC staff technical reviews and site inspections on at least an **annual basis** or more frequently as circumstances indicate. Prior to each FERC staff technical review and site inspection, Port Arthur LNG shall respond to a specific data request including information relating to possible design and operating conditions that may have been imposed by other agencies or organizations. Up-to-date detailed P&IDs reflecting facility modifications and provision of other pertinent information not included in the semi-annual reports described below, including facility events that have taken place since the previously submitted semi-annual report, shall be submitted. *(section 4.12.6)*

128. **Semi-annual** operational reports shall be filed with the Secretary to identify changes in facility design and operating conditions; abnormal operating experiences; activities (e.g., ship arrivals, quantity and composition of imported and exported LNG, liquefied and vaporized quantities, boil off/flash gas); and plant modifications, including future plans and progress thereof. Abnormalities shall include, but not be limited to, unloading/loading/shipping problems, potential hazardous conditions from offsite vessels, storage tank stratification or rollover, geysering, storage tank pressure excursions, cold spots on the storage tanks, storage tank vibrations and/or vibrations in associated cryogenic piping, storage tank settlement, significant equipment or instrumentation malfunctions or failures, non-scheduled maintenance or repair (and reasons therefore), relative movement of storage tank inner vessels, hazardous fluids releases, fires involving hazardous fluids and/or from other sources, negative pressure (vacuum) within a storage tank, and higher than predicted boil off rates. Adverse weather conditions and the effect on the facility also shall be reported. Reports shall be submitted **within 45 days after each period ending June 30 and December 31**. In addition to the above items, a section entitled "Significant Plant Modifications Proposed for the Next 12 Months (dates)" shall be included in the semi-annual operational reports. Such information will provide the FERC staff with early notice of anticipated future construction/maintenance at the LNG facilities. *(section 4.12.6)*

129. In the event the temperature of any region of any secondary containment, including imbedded pipe supports, becomes less than the minimum specified operating temperature for the material, the Commission shall be notified **within 24 hours** and procedures for corrective action shall be specified. *(section 4.12.6)*

130. Significant non-scheduled events, including safety-related incidents (e.g., LNG, condensate, refrigerant, or natural gas releases; fires; explosions; mechanical failures; unusual over pressurization; and major injuries) and security-related incidents (e.g., attempts to enter site, suspicious activities) shall be reported to the

FERC staff. In the event that an abnormality is of significant magnitude to threaten public or employee safety, cause significant property damage, or interrupt service, notification shall be made **immediately**, without unduly interfering with any necessary or appropriate emergency repair, alarm, or other emergency procedure. In all instances, notification shall be made to the FERC staff **within 24 hours**. This notification practice shall be incorporated into the liquefaction facility's emergency plan. Examples of reportable hazardous fluids-related incidents include:

a. fire;

b. explosion;

c. estimated property damage of $50,000 or more;

d. death or personal injury necessitating in-patient hospitalization;

e. release of hazardous fluids for 5 minutes or more;

f. unintended movement or abnormal loading by environmental causes, such as an earthquake, landslide, or flood, that impairs the serviceability, structural integrity, or reliability of an LNG facility that contains, controls, or processes hazardous fluids;

g. any crack or other material defect that impairs the structural integrity or reliability of an LNG facility that contains, controls, or processes hazardous fluids;

h. any malfunction or operating error that causes the pressure of a pipeline or LNG facility that contains or processes hazardous fluids to rise above its maximum allowable operating pressure (or working pressure for LNG facilities) plus the build-up allowed for operation of pressure-limiting or control devices;

i. a leak in an LNG facility that contains or processes hazardous fluids that constitutes an emergency;

j. inner tank leakage, ineffective insulation, or frost heave that impairs the structural integrity of an LNG storage tank;

k. any safety-related condition that could lead to an imminent hazard and cause (either directly or indirectly by remedial action of the operator), for purposes other than abandonment, a 20 percent reduction in operating pressure or shutdown of operation of a pipeline or an LNG facility that contains or processes hazardous fluids;

l. safety-related incidents from hazardous fluids transportation occurring at or en route to and from the LNG facility; or

m. an event that is significant in the judgment of the operator and/or management even though it did not meet the above criteria or the guidelines set forth in an LNG facility's incident management plan.

In the event of an incident, the Director of OEP has delegated authority to take whatever steps are necessary to ensure operational reliability and to protect human life, health, property, or the environment, including authority to direct the liquefaction facility to cease operations. Following the initial company notification, the FERC staff would determine the need for a separate follow-up report or follow up in the upcoming semi-annual operational report. All company follow-up reports shall include investigation results and recommendations to minimize a reoccurrence of the incident. *(section 4.12.6)*

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Port Arthur LNG, LLC PALNG Common Facilities Company, LLC	Docket No.	CP17-20-000
Port Arthur Pipeline, LLC	Docket Nos.	CP17-21-000 CP17-21-001 CP18-7-000

(Issued April 18, 2019)

GLICK, Commissioner, *dissenting*:

1. I dissent from today's order because it violates both the Natural Gas Act[1] (NGA) and the National Environmental Policy Act[2] (NEPA). In particular, the Commission is again refusing to consider the consequences its actions have for climate change. Neither the NGA nor NEPA permit the Commission to assume away the climate change implications of constructing and operating this liquefied natural gas (LNG) facility. Yet that is precisely what the Commission is doing today.

2. In the order authorizing Port Arthur LNG, LLC's LNG export terminal (LNG Terminal) pursuant to section 3 of the NGA and the associated natural gas pipelines (Pipeline Projects) pursuant to section 7 of the NGA (collectively, Project), the Commission treats GHG emissions differently than all other environmental impacts. By refusing to assess the significance of the impact of the Project's GHG emissions, even after quantifying them, the Commission not only neglects its obligation to assess the environmental impacts, but also its concomitant duty to explore possible mitigation measures to reduce any significant adverse effects. This systematic failure to consider the Project's impacts on climate change is what allows the Commission to misleadingly state that "[a]ll [environmental] impacts . . . will be reduced to less-than-significant

[1] 15 U.S.C. §§ 717b, 717f (2012).

[2] National Environmental Policy Act of 1969, 42 U.S.C. §§ 4321 *et seq.*

(continued ...)

levels"[3] and, as a result, conclude that the Project satisfies the NGA's public interest standards.[4]

I. The Commission's Public Interest Determinations Are Not the Product of Reasoned Decisionmaking

3. The NGA's regulation of LNG import and export facilities "implicate[s] a tangled web of regulatory processes" split between the U.S. Department of Energy (DOE) and the Commission.[5] The NGA establishes a general presumption favoring the import and export of LNG unless there is an affirmative finding that the import or export "will not be consistent with the public interest."[6] Section 3 of the NGA, which governs LNG imports and exports, provides for two independent public interest determinations: one regarding the import or export of LNG itself and one regarding the facilities used for that import or export. DOE determines whether the import or export of LNG is consistent with the public interest, with transactions among free trade countries legislatively deemed to be "consistent with the public interest."[7] The Commission evaluates whether "an application for the siting, construction, expansion, or operation of an LNG terminal" is

[5] *Sierra Club v. FERC*, 827 F.3d 36, 40 (D.C. Cir. 2016) (*Freeport*).

[6] 15 U.S.C. §717b(a); *see EarthReports, Inc. v. FERC*, 828 F.3d 949, 953 (D.C. Cir. 2016) (citing *W. Va. Pub. Servs. Comm'n v. Dep't of Energy*, 681 F.2d 847, 856 (D.C. Cir. 1982) ("NGA [section] 3, unlike [section] 7, 'sets out a general presumption favoring such authorization.'")). Under section 7 of the NGA, the Commission approves a proposed pipeline if it is shown to be consistent with the public interest, while under section 3, the Commission approves a proposed LNG import or export facility unless it is shown to be inconsistent with the public interest. *Compare* 15 U.S.C. § 717b(a) *with* 15 U.S.C. §717f(a), (e).

[7] 15 U.S.C. § 717b(c). The courts have explained that, because the authority to authorize LNG exports rests with DOE, NEPA does not require the Commission to consider the upstream or downstream GHG emissions that may be indirect effects of the export itself when determining whether the related LNG export facility satisfies section 3 of the NGA. *See Freeport*, 827 F.3d at 46-47; *see also Sierra Club v. FERC*, 867 F.3d 1357, 1373 (D.C. Cir. 2017) (*Sabal Trail*) (discussing *Freeport*). NEPA still requires, however, that the Commission consider the direct GHG emissions associated with a proposed LNG export facility. *See Freeport*, 827 F.3d at 41, 46.

(continued ...)

consistent with the public interest.[8] Pursuant to that authority, the Commission must approve a proposed LNG facility unless the record shows that the facility would be inconsistent with the public interest.[9]

4. As part of that determination, the Commission must examine a proposed LNG facility's impact on the environment and public safety. A facility's impact on climate change must be part of a public interest determination under the NGA.[10] Nevertheless, the Commission maintains that it need not consider whether the Project's contribution to climate change is significant because it lacks a means to do so—or at least so it claims.[11] However, the shocking part of the Commission's rationale is what comes next. Based on this alleged inability to assess significance, the Commission concludes that the Project will have no significant environmental impact.[12] That is the equivalent of saying that an action that is known to be dangerous is actually safe because we do not know exactly how dangerous it is. That is ludicrous and it certainly does not give climate change the serious consideration it deserves and that the law demands.

5. The Commission's failure to consider the impact of the Project's GHG emissions is all-the-more glaring given the volume of emissions at issue in this proceeding. The Commission points out that the operation of the Project will directly emit 4.77 million

---

[8] 15 U.S.C. § 717b(e). In 1977, Congress transferred the regulatory functions of NGA section 3 to DOE. DOE, however, subsequently delegated to the Commission authority to approve or deny an application for the siting, construction, expansion, or operation of an LNG terminal, while retaining the authority to determine whether the import or export of LNG to non-free trade countries is in the public interest. *See EarthReports, Inc.*, 828 F.3d at 952-53.

[9] *See Freeport*, 827 F.3d at 40-41.

[10] *See Sabal Trail*, 867 F.3d at 1373 (explaining that the Commission may "deny a pipeline certificate on the ground that the pipeline would be too harmful to the environment"); *see also Atl. Ref. Co. v. Pub. Serv. Comm'n of N.Y.*, 360 U.S. 378, 391 (1959) (holding that the NGA requires the Commission to consider "all factors bearing on the public interest").

[11] Certificate Order, 167 FERC ¶ 61,052 at P 138; *see also* Final EIS at 4-361–4-362 (explaining that "[t]here is no generally accepted methodology to estimate what extent a project's incremental contribution to [GHG] emissions would result in physical effects on the environment").

[12] Certificate Order, 167 FERC ¶ 61,052 at P 101; Final EIS at ES-10.

(continued ...)

metric tons of GHGs annually.[13] Given the Commission's acknowledgment of that GHG emissions contribute to climate change,[14] the decision to exclude GHG emissions from playing any role in the Commission's public interest analysis is indefensible.

6. The implications of the Commission's approach to evaluating the impacts of GHG emissions extend beyond any single proceeding under NGA section 3 or section 7. Taking the Commission's approach to its logical conclusion, the Commission would approve any project regardless of the amount of GHGs emitted without ever determining the significance of their environmental impact. If the Commission's assessment of that impact will not change no matter the volume of GHG emissions at issue, those emissions and their consequences cannot meaningfully factor into the public interest determination. Approving a project that may significantly contribute to the harms caused by climate change without meaningfully evaluating the significance of that impact or considering it as part of the public interest determination is contrary to law, arbitrary and capricious, and not the product of reasoned decisionmaking.[15]

II. The Commission Fails to Satisfy Its Obligations under NEPA

7. In order to evaluate the environmental consequences of the Project under NEPA, the Commission must consider the harm caused by the Project's GHG emissions and "evaluate the 'incremental impact' that these emissions will have on climate change or the environment more generally."[16] As noted, the Final EIS states that the Project will directly emit 4.77 million metric tons of GHGs annually.[17] Although that quantification

---

[13] Certificate Order, 167 FERC ¶ 61,052 at P 137; Final EIS at Table 4.11.1-7 (Carbon dioxide emissions in the Final EIS are expressed in short tons.).

[14] Final EIS at 4-360.

[15] As noted, the NGA "requires the Commission to evaluate all factors bearing on the public interest," *Atl. Ref. Co.*, 360 U.S. at 391, which *Sabal Trail* held includes a facility's contribution to the harms caused by climate change, 867 F.3d at 1373.

[16] *Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, 538 F.3d 1172, 1216 (9th Cir. 2008); *WildEarth Guardians v. Zinke*, No. CV 16-1724 (RC), 2019 WL 1273181, at *1 (D.D.C. Mar. 19, 2019) (explaining that the agency was required to "provide the information necessary for the public and agency decisionmakers to understand the degree to which [its] decisions at issue would contribute" to the "impacts of climate change in the state, the region, and across the country").

[17] *Supra* note 13.

(continued ...)

of the Project's GHG emissions is a necessary step toward meeting the Commission's NEPA obligations, listing the volume of emissions alone is insufficient.[18]

8. As an initial matter, identifying the consequences that those emissions will have for climate change is essential if NEPA is to play the disclosure and good government roles for which it was designed. The Supreme Court has explained that NEPA's purpose is to "ensure[] that the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts" and to "guarantee[] that the relevant information will be made available to the larger audience that may also play a role in both the decisionmaking process and the implementation of that decision."[19] It is hard to see how hiding the ball on a project's climate impacts is consistent with either of those purposes.

9. In addition, under NEPA, a finding of significance informs the Commission's inquiry into potential ways of mitigating environmental impacts.[20] The Supreme Court has held that an EIS must "contain a detailed discussion of possible mitigation measures" to address adverse environmental impacts.[21] The Court explained that, "[w]ithout such a discussion, neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects" of a project, making an examination of possible mitigation measures necessary to ensure that the agency has taken a "hard look" at the environmental consequences of the action at issue.[22] Consistent with this

---

[18] *See Ctr. for Biological Diversity*, 538 F.3d at 1216 ("While the [environmental document] quantifies the expected amount of CO_2 emitted . . . , it does not evaluate the 'incremental impact' that these emissions will have on climate change or on the environment more generally . . . ."); *Klamath-Siskiyou Wildlands Ctr. v. Bureau of Land Mgmt.*, 387 F.3d 989, 995 (9th Cir. 2004) ("A calculation of the total number of acres to be harvested in the watershed is a necessary component . . . , but it is not a sufficient description of the actual environmental effects that can be expected from logging those acres.").

[19] *Dep't of Transp. v. Pub. Citizen*, 541 U.S. 752, 768 (2004) (citing *Robertson v. Methow Valley Citizens Coun.*, 490 U.S. 332, 349 (1989)).

[20] 40 C.F.R. § 1502.16 (2018) (NEPA requires an implementing agency to form a "scientific and analytic basis for the comparisons" of the environmental consequences of its action in its environmental review, which "shall include discussions of . . . [d]irect effects and their significance.").

[21] *Robertson*, 490 U.S. at 351.

(continued ...)

obligation, the Final EIS discusses mitigation measures to ensure that the Project's adverse environmental impacts, excluding GHG emissions, are reduced to less than significant levels.[23] For example, in order to find that the Project's impacts on wetlands are not anticipated to be significant,[24] the Commission relies on compensatory mitigation including the purchase of mitigation credits.[25] The Commission not only has the obligation to discuss mitigation of adverse environmental impacts under NEPA, but also the authority to condition certificates under section 3 and 7 of the NGA.[26] Once again, however, the Project's climate change impacts are treated differently. By refusing to assess significance, the Commission escapes its obligation to consider mitigation measures for the Project's GHG emissions.

10. In refusing to even assess the significance of the Project's GHG emissions during the environmental review process, the Commission relegates climate change to a negligible role, at best, in its NEPA analysis. Nothing in today's order justifies this result. The Commission argues that it cannot determine whether the Project's contribution to climate change is significant, relying on the premise that there is no "generally accepted methodology" to estimate a project's impact on climate change, either locally or nationally.[27] As a logical matter, the argument that there is no single standard methodology for evaluating the significance of GHG emissions does not excuse the Commission from assessing the Project's environmental impacts under NEPA. The

(including in the scope of an environmental impact statement mitigation measures).

[23] Certificate Order, 167 FERC ¶ 61,052 at PP 102, 106, 109, 112, 114, 128 (The Commission states that adverse environmental impacts to geology, water, wetlands, vegetation, wildlife, and air quality will not be significant if the Applicant implements proposed mitigation measures.).

[24] Final EIS at ES-6.

[25] *Id.*; *see also* Final EIS at 4-58–4-59 (The U.S. Army Corp of Engineers has a goal of "no net loss" for wetlands and requires compensatory mitigation for all permanent wetland loss. The Final EIS relies on multiple mitigation measures including contributed dredging materials for emergent wetlands and wetland mitigation credit purchases.).

[26] 15 U.S.C. § 717b(e)(3)(A); 15 U.S.C. § 717f(e); Certificate Order, 167 FERC ¶ 61,052 at P 141 ("[T]he Commission has the authority to take whatever steps are necessary to ensure the protection of environmental resources . . . , including authority to impose any additional measures deemed necessary . . . .").

[27] Final EIS at 4-361–4-362; *see also* Certificate Order, 167 FERC ¶ 61,052 at P 138.

(continued ...)

claimed absence of a standard methodology is no justification for effectively ignoring those emissions.[28]

11. Moreover, the argument that there is no single standard methodology for evaluating the significance of GHG emissions is a red herring. The lack of any single methodology does not prevent the Commission from adopting *a* methodology, even if others are available. The Commission has several tools to assess the harm from the Project's contribution to climate change. By measuring the long-term damage done by a ton of carbon dioxide, the Social Cost of Carbon links GHG emissions to *actual* environmental effects from climate change, thereby facilitating the necessary "hard look" at the Project's environmental impacts that NEPA requires. Especially when it comes to a global problem like climate change, a measure for translating a single project's climate change impacts into concrete and comprehensible terms plays a useful role in the NEPA process by putting the harm in terms that are readily accessible for both agency decisionmakers and the public at large. Yet, the Commission continues to ignore the Social Cost of Carbon, relying instead on deeply flawed reasoning that I have previously critiqued at length.[29]

12. Regardless of tools or methodologies available, the Commission can use its judgement and discretion to consider all factors and determine, quantitatively or qualitatively, whether the Project's GHG emissions have a significant impact on climate change. After all, that is precisely what the Commission does in other aspects of its environmental review. For example, consider the Commission's evaluation of the Project's impact on the surrounding land. The Final EIS determines that a total of 992

[28] My colleague, Commissioner LaFleur, wrestled with these questions and reached a judgment on both the significance of the impact of the GHG emissions and the merits of the Project notwithstanding the lack of analysis in the Commission's order. Certificate Order, 167 FERC ¶ 61,052 (LaFleur, Comm'r, concurring at P 8). Providing additional context regarding the Project's GHG emissions and their cumulative impact is a useful first step that promotes public disclosure and informed decisionmaking. But neither that context nor a concurrence assessing the significance of the impact of the Project's GHG emissions can remedy the order's erroneous conclusion that the Commission cannot evaluate the significance of the Project's contribution to climate change or its assumption that such a contribution is insignificant. Nor can a concurrence remedy the absence of any discussion in the record of the significance of the Project's contribution to climate change.

[29] *See, e.g.*, *Fla. Se. Connection, LLC*, 164 FERC ¶ 61,099 (2018) (Glick, Comm'r, dissenting).

(continued ...)

acres of vegetation and upland forest will be permanently affected by the Project,[30] but then concludes that the Project "will not have a significant impact on vegetation."[31] The Final EIS provides no "standard methodology" available to the Commission to evaluate this impact.[32] Instead, the Commission uses its judgment to conduct a qualitative review to assess the Project's impact on vegetation and conclude that the impact would not be significant based on the "minor nature of the impacts."[33] The Commission's refusal to exercise similar qualitative discretion and judgment when it comes to evaluating the impacts of GHG emissions is arbitrary and capricious and willfully ignorant.

13. The Commission's refusal to seriously consider the significance of the impact of the Project's GHG emissions is even more mystifying because NEPA "does not dictate particular decisional outcomes."[34] NEPA "'merely prohibits uninformed—rather than unwise—agency action.'"[35] Taking the matter seriously—and rigorously examining a project's impacts on climate change—does not necessarily prevent any of my colleagues from ultimately concluding that a project meets the public interest standard. Indeed, a thorough investigation of a project's contribution to climate change would also help infrastructure developers by reducing their legal risk in the appeals that will inevitably follow. At the end of the day, no one benefits from the Commission's refusal to consider a project's impact on climate change.

For these reasons, I respectfully dissent.

_____

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Port Arthur LNG, LLC PALNG Common Facilities Company, LLC	Docket Nos.	CP17-20-000
Port Arthur Pipeline, LLC		CP17-21-000 CP17-21-001 CP18-7-000

(Issued April 18, 2019)

LaFLEUR, Commissioner, *concurring*:

1. Today's order grants authorization to Port Arthur LNG, LLC and PALNG Common Facilities Company, LLC (collectively Port Arthur LNG) pursuant to section 3 of the Natural Gas Act (NGA),[1] to site, construct and operate a new liquefied natural gas (LNG) export terminal (Port Arthur LNG Project) in Port Arthur, Texas.[2] The Commission also authorizes Port Arthur Pipeline, LLC (Port Arthur Pipeline), pursuant to section 7 of the NGA,[3] to construct and operate both, the Texas Connector Project to provide up to 2,000,000 dekatherms per day (Dth/day) of natural gas transportation service to the proposed export terminal and the Louisiana Connector Project to provide 2,000,000 Dth/day to the proposed export terminal. For the reasons discussed below, I concur.

2. Under section 3 of the NGA, oversight for LNG export is divided between the Commission and the U.S. Department of Energy (DOE). Specifically, it is the DOE, not the Commission, which retains the exclusive authority over the export of the natural gas as a commodity, including the responsibility to consider whether the exportation of that

[1] 15 U.S.C. § 717b (2012).

[2] *Port Arthur LNG, LLC*, 167 FERC ¶ 61,052 (2019) (Certificate Order).

[3] 15 U.S.C. § 717f(c) (2012).

(continued ...)

gas is in the public interest.[4] If the export will be sent to a free trade country, the NGA automatically "deems" the export "to be consistent with the public interest."[5]

3. This framework leaves the Commission with the limited authority to approve or deny an application for the siting, construction, expansion, or operation of the LNG terminal facilities. In exercising its section 3 authority, the Commission's responsibility includes conducting a public interest analysis to consider the technical and environmental aspects of the LNG facilities themselves. Our environmental review is governed by the National Environmental Policy Act[6] (NEPA) which, as relevant here, requires the Commission to take a "hard look" at the potential environmental impacts that could result from the Port Arthur LNG Project, including the climate change impacts of the proposed project.

4. The U.S. Court of Appeals for the D.C. Circuit (D.C. Circuit) has made clear that the DOE, rather than the Commission, has the responsibility to assess upstream and downstream indirect GHG emission impacts of LNG exports as part of the DOE's determination of the public interest in exporting the natural gas.[7] However, the Commission still has the clear responsibility to disclose and consider the direct and cumulative GHG impacts of the proposed LNG export facility, and make significance determinations regarding such impacts, in order to satisfy our obligations under NEPA and section 3 of the NGA.

5. I appreciate that the Commission has disclosed in the Certificate Order the direct GHG emissions of the Port Arthur LNG Project and the Texas and Louisiana Connector pipeline projects, and has provided important context by comparing them to the national GHG emissions inventory.[8] We have included this comparison in the past to provide

[7] *Sierra Club v. FERC*, 827 F.3d 36, 47 (D.C. Cir. 2016) (*Freeport*) ("[T]he Commission's NEPA analysis did not have to address the indirect effects of the anticipated *export* of natural gas. That is because the Department of Energy, not the Commission, has the sole authority to license the export of any natural gas going through the Freeport facilities."). *See also Sierra Club v. FERC*, 827 F.3d 59 (D.C. Cir. 2016) (*Sabine Pass*); *EarthReports, Inc. v. FERC*, 823 F.3d 949 (D.C. Cir. 2016).

[8] Certificate Order, 167 FERC ¶ 61,052 at P 137. Final Environmental Impact Statement (EIS) at Table 4.11.1-7. The Final EIS also discloses the direct GHG emissions from the construction of the LNG terminal and the pipelines: 197,714 metric *(continued ...)*

context to the indirect emissions of pipeline projects, and the D.C. Circuit has taken note of the Commission's efforts to use available national, regional, and state emissions inventories as part of our climate change analysis.[9]

6. I recognize that the disclosure of the data, and the context provided, is only the first step to assist the Commission in determining the significance of a given rate or volume of GHG emissions as part of our climate change analysis. As a second step, NEPA requires that we analyze that information to determine whether a specific impact is, in fact, significant. [10] Unfortunately, to date, the Commission has not established a framework for making a significance determination. However, the magnitude of the direct GHG emission from the Port Arthur LNG Project are substantial and certainly appear to be significant as contemplated by NEPA.

---

tons during the multiple years of construction. Table 4.11.1-4, 4.11.1-5 and 4.11.1-6. *See Sierra Club v. FERC*, 867 F.3d 1357 at 1374 (D.C. Cir. 2017) (*Sabal Trail*) ("Quantification would permit the agency to compare the emissions from this project to emissions from other projects, to total emissions from the state or the region, or to regional or national emissions-control goals.")

[9] *E.g., Town of Weymouth, Mass. v. FERC*, No. 17-1135, 2018 WL 6921213 (D.C. Cir. Dec. 27, 2018)(per curiam) (speaking approvingly of the Commission's quantification of the project's expected GHG emissions, which included a comparison of the Atlantic Bridge Project against state and regional climate change goals.); *Appalachian Voices v. FERC*, No. 17-1721 (D.C. Cir. Feb. 19, 2019) (per curiam) (dismissing claims that FERC failed to adequately consider downstream climate impacts of the Mountain Valley Pipeline project by noting, among other things, that "FERC provided an estimate of the upper bound of emissions resulting from end-use combustion…"). By comparison, in *Sabal Trail*, the D.C. Circuit vacated and remanded the Commission's authorization of the Southeast Market Pipeline Project and directed the Commission to both quantify and consider the project's downstream GHG emissions or explain in more detail why it cannot do so. In response to the Court order, the Commission quantified the net, gross, and full-burn of downstream GHG emissions and compared them to the state and national GHG emissions inventories.

[10] Under NEPA, when evaluating the significance of a particular impact, the Commission must consider both context and intensity. 40 C.F.R. § 1508.27(a) (2017) (Context means "that the significance of an action must be analyzed in several contexts such as society as a whole (human, national), the affected region, the affected interests and the locality."). 40 C.F.R. § 1508.27(b) (2017) (Intensity refers to "the severity of the impact").

(continued ...)

7. I remain frustrated by the Commission's continued refusal to even consider how we might develop a framework for assessing the potential significance of GHG emissions.[11] While it might be easier to assess significance if we had national emissions reduction targets, like EPA's Clean Power Plan or the Paris Climate Accord,[12] to use as part of our framework, the lack of such targets does not prevent the Commission from making a significance determination in this or in any other case. In fact, the Commission makes challenging determinations on quantitative and qualitative issues in many other areas of our work.[13]

---

[11] In my concurrence on the Driftwood LNG Project, I explain that finding the GHG emissions to be significant does not mean the Commission cannot approve a proposed project. NEPA requires the Commission to disclose and consider all environmental impacts of a proposed action, but NEPA does not mandate particular results, it simply prescribes the necessary process for considering each impact. Once a significant impact has been identified then the next logical step is to think about ways to mitigate that impact. *Driftwood LNG LLC*, 167 FERC ¶ 61,054 (2019) (LaFleur, Comm'r, *concurring* at PP 9-10) (citing *KN Wattenberg Transmission LLC,* 90 FERC ¶ 61,322, at 62,083 (2000) (citing and quoting *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 350 (1989)).

[12] As noted in the Certificate Order, the EPA's Clean Power Plan and the Paris climate account are pending repeal and withdrawal, respectively. Certificate Order, 167 FERC ¶ 61,052 at P 137, nt. 194.

[13] Many of the core areas of the Commission's work have required the development of analytical frameworks, often a combination of quantitative measurements and qualitative assessments, to fulfill the Commission's responsibilities under its broad authorizing statutes. This work regularly requires that the Commission exercise judgment, based on its expertise, precedent, and the record before it. For example, to help determine just and reasonable returns on equity (ROEs) under the Federal Power Act, Natural Gas Act, and Interstate Commerce Act, the Commission identifies a proxy group of comparably risky companies, applies a method or methods to determine a range of potentially reasonable ROEs (i.e., the zone of reasonableness), and then considers various factors to determine the just and reasonable ROE within that range. *See also*, *e.g.*, *Promoting Transmission Investment through Pricing Reform*, Order No. 679, FERC Stats. & Regs. ¶ 31,222, *order on reh'g*, Order No. 679-A, FERC Stats. & Regs. ¶ 31,236 (2006), *order on reh'g*, 119 FERC ¶ 61,062 (2007) (establishing Commission regulations and policy for reviewing requests for transmission incentives); *Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities*, Order No. 1000, FERC Stats. & Regs. ¶ 31,323 (2011), *order on reh'g*, Order No. 1000-A, 139 FERC ¶ 61,132, *order on reh'g and clarification*, Order No. 1000-B, 141 FERC ¶ 61,044 *(continued ...)*

8. I do not believe it is beyond the capability of this Commission to determine whether a given rate or volume of GHG emissions should be considered significant. The Commission has grappled with every other identifiable and measurable environmental impact; for example, we quantify, consider, and mitigate impacts to land, water, and species, and we make determinations on whether the impacts to wetlands or mussels are significant.[14] For reasons that I do not find persuasive, the Commission treats climate impacts differently than all other environmental impacts in our environmental review, and refuses to make such determinations regarding climate change impacts. Instead, the Commission summarily finds that because it cannot decide how to conduct a meaningful analysis of climate change impacts, it is not required to conduct *any* analysis of significance. I disagree.

9. With regards to cumulative impacts analysis, I appreciate that the analysis in the final EIS addresses a range of resources impacted within the identified geographic scope of the Port Arthur LNG Project. However, as I highlighted in my concurrence in

---

(2012), *aff'd sub nom. S.C. Pub. Serv. Auth.* v. *FERC*, 762 F.3d 41 (D.C. Cir. 2014) (requiring, among other things, the development of regional cost allocation methods subject to certain general cost allocation principles); *BP Pipelines (Alaska) Inc.*, Opinion No. 544, 153 FERC ¶ 61,233 (2015) (conducting a prudence review of a significant expansion of the Trans Alaska Pipeline System). I also note that the Commission is currently actively considering a broad topic – resilience – whose scope and complexity might similarly require the development of new analytical frameworks for conducting the Commission's work.

[14] In the Final EIS, the Commission made a significance determination on: geology, soils, water resources, wildlife, aquatic resources, wetlands, vegetation, wildlife resources, land use, recreation, and visual impacts, socioeconomics, air quality, noise, and reliability and safety. The Commission also determined that adverse environmental impacts to geology, water, wetlands, vegetation, wildlife, and air quality would not be significant with the proposed mitigation measures. Moreover, in making such determinations, the Commission has frequently relied solely on a qualitative assessment and Commission staff discretion, rather than quantitative analysis, as it did with the vegetation impacts in this case. Certificate Order, 167 FERC ¶ 61,052 at PP 110-112. I reject the view that the difficulty of quantifying GHG emissions impacts is an excuse for failing to evaluate the significance of those impacts.

(continued ...)

Calcasieu Pass LNG,[15] I disagree with the decision to exclude GHG emissions from the cumulative impacts analysis.[16]

10. As I have stated before, it takes minimal effort to disclose the GHG emissions for the other FERC projects identified in the final EIS's cumulative impacts air region, and include an estimate of the total annual potential GHG emissions associated with a proposed project and other nearby projects as part of our environmental review. I am disappointed that the final EIS does not do so. I recognize that using the 50 km air region is a rudimentary proxy for assessing the cumulative impacts of GHG emissions because those emissions are not typically measured on a local or regional basis.[17] But disclosing that minimal information would at least be a start, and I believe that failure to do so creates added legal risk.[18]

11. Since the Commission fails to disclose the cumulative GHG emissions numbers, I have included an estimate of them in Table 1 attached to my concurrence. I believe that,

[16] Final EIS at 4-330-4-337, Table 4.13.1-1.

[17] 50 kilometers is the distance used in the final EIS and by the EPA for cumulative modeling of large sources of air pollutants (nitrogen oxides [NO_x], sulfur oxides [SO_x], particulate matter [PM], etc.), volatile organic compounds, and hazardous air pollutants. GHGs are not included. Final EIS at 4-324- 4-325, Table 4.13-1.

[18] Recently, the U.S. District Court for D.C. criticized the Bureau of Land Management (BLM) for failing to disclose the cumulative impacts of GHG emissions in sufficient detail. The court found that NEPA requires "BLM quantify the emissions from each leasing decision—past, present or reasonably foreseeable—and compare those emissions to regional and national emissions, setting forth with reasonable specificity the cumulative effect of the leasing decision at issue." *WildEarth Guardians v. Zinke*, No. CV 16-1724 (RC), 2019 WL 1273181, at *46 (D.D.C. Mar. 19, 2019). By comparison, the U.S. District Court for Colorado, upheld BLM, finding they took an appropriately hard look at cumulative climate change impacts where, the agency: (1) looked at statewide emissions levels from emitting coal-fired power plants in Colorado and provided a comparative assessment; (2) provided a qualitative analysis of climate change and the role played by GHG emissions; (3) performed a regional cumulative impacts analysis for the future mineral development in the region for ten years; and (4) quantified the GHG emissions from both projects. *Citizens for a Healthy Cmty. v. Bureau of Land Mgmt.*, No. 1:17-CV-02519-LTB-GPG, 2019 WL 1382785, at *20-21 (D. Colo. Mar. 27, 2019).

(continued ...)

consistent with our NEPA obligations, at a minimum, the GHG emissions must be disclosed and considered, both cumulatively and with respect to individual facilities.

12. I will continue to consider and evaluate these issues as they arise in individual proceedings, however, I believe the Commission should proactively address these issues. If we do not, further guidance from the courts on our NEPA responsibility to consider climate change will likely require us to do so. Such guidance could create additional legal risk and add additional complexities to our reviews under both Section 3 and Section 7 of the NGA. Thus, I believe that proactive solutions to this challenging problem must be explored.

13. Given my review of the record including climate impacts, I find the Port Arthur LNG Project is not inconsistent with the public interest.[19] As for Port Arthur Pipeline's Texas Connector and Louisiana Connector Projects, which is solely serving the Port Arthur LNG Project, I find the pipeline is in the public convenience and necessity. The D.C. Circuit has recognized that, as with the appended LNG export facility, the downstream indirect GHG emissions for the pipeline are not part of the Commission's environmental review and consideration.[20] Therefore, my public interest determination is based on a review of the rest of the environmental review of the pipeline project. After carefully balancing the need for the project and its environmental impacts, I find the project is in the public interest.

For these reasons, I respectfully concur.

_____
Cheryl A. LaFleur
Commissioner

[19] I recognize that it is difficult to balance the GHG impacts with the potential public benefits of export, since the latter are part of DOE's responsibility, and the Commission is working under a presumption of public interest. I have considered the information provided by the 2014 National Energy Technology Lab (NETL*), Life Cycle Greenhouse Gas Perspective on Exporting Liquefied Natural Gas from the United States*, to provide some context to benefits. This analysis calculates the life cycle GHG emissions for regional coal and imported natural gas power in Europe and Asia. The approach includes GHG impacts of liquefaction and finds, on balance that export of US LNG has less climate impacts than some alternatives. As I have stated before, that analysis should be updated based on more recent information and proposed projects.

EXECUTIVE SUMMARY

Port Arthur LNG, LLC (Owner) plans to develop, construct and operate an LNG Export Terminal on a site located on the western shoreline of the Port Arthur Canal in Jefferson County, Texas. The LNG marine facilities for the project will consist of two LNG export berths, located within a proposed dredged slip adjacent to the Port Arthur Canal.

M&N has been engaged by the Owner to update and optimize the preliminary design of the marine facilities developed in 2015. Supplementing this optimization work, M&N has been retained to conduct a sedimentation study to determine sediment deposition rates in the proposed dredge slip, the turning circle fronting the facilities and at the proposed Materials Offloading Facility (MOF) located upstream from the LNG export berths in the Port Arthur Canal.

A Delft3D sediment transport model was developed to simulate sedimentation in Port Arthur Canal and to estimate sediment deposition rates in LNG Export Terminal and at the MOF. The model was calibrated to match sedimentation rates calculated in Port Arthur Canal using historical dredge records.

Expected annual sediment deposition volumes estimated in different portions of the project site are summarized in the table below.

Summary of sedimentation model results

Project area	Area (sq. yd)	Annual sediment deposition volume (cu. yd)	Annual sedimentation rate (ft)
LNG Export Berths & Dredged Slip	203,245	145,557	2.15
Turning Circle	272,650	128,222	1.41
MOF	33,350	12,914	1.16

It can be seen that the LNG Export Terminal exhibits a higher sedimentation rate (2.15 ft/yr) than other project areas which are in the Port Arthur Canal (1.16–1.41 ft/yr). It was seen from the local hydrodynamic model results (9177-01RP0001 Hydrodynamic Modeling Report) that there is significant eddy formation inside the LNG Export Terminal during flood and ebb tides. The eddies tend to bring more suspended sediments into the dredge basin due to longer retention times and lower current speeds inside the LNG Export Terminal, which promotes sediment settling and increased sedimentation.

The sediment characteristics such as suspended sediment concentration (SSC) and settling velocity often exhibit temporal and spatial variations. It was seen from available suspended sediment concentration (SSC) data in Port Arthur Canal that, the SSC varied between 6 and 111 mg/l, with a mean of 22 mg/l. An SSC of 46 mg/l and settling velocity

of 0.3 mm/s was used to establish expected sedimentation rates. In order to assess the effect of SSC and settling velocity variations on sedimentation rates at the project areas, a set of model sensitivity runs were conducted. The results are summarized in the table below.

Summary of model sensitivity runs

Settling velocity (mm/s)	Suspended sediment concentration (mg/l)	Annual sedimentation rate (ft/yr)		
		LNG Export Berths & Dredged Slip	Turning Circle	MOF
0.1	120	2.46	1.48	1.14
0.3	46	2.15	1.41	1.16
0.4	36	1.99	1.36	1.15

While the sedimentation rate estimates calculated using 0.3 mm/s settling velocity can be considered to represent average conditions, it is possible that in any given year, an increase in sedimentation of up to 15% can be expected.

1.0 INTRODUCTION

Port Arthur LNG, LLC (Owner) plans to develop, construct and operate an LNG Export Terminal on a site located on the western shoreline of the Port Arthur Canal in Jefferson County, Texas. The LNG marine facilities for the project will consist of two LNG export berths, located within a proposed dredged slip adjacent to the Port Arthur Canal.

Moffatt & Nichol (M&N) was originally engaged to design the marine facilities at the FEED level in early 2015. M&N has since been engaged by the Owner to update and optimize a preliminary design of the marine facilities. Supplementing this optimization work, M&N has been retained to conduct a sedimentation study to determine sediment deposition rates in the proposed dredge slip, the turning circle fronting the facilities and at the proposed Materials Offloading Facility (MOF) located upstream from the LNG export berths in the Port Arthur Canal. Figure 1-1 shows the location of the proposed marine facilities.

This report describes a two-dimensional sediment transport model with hydrodynamic and sediment transport modules developed by M&N in order to estimate sedimentation in the proposed marine facilities.

Figure 1-1: Locations of proposed LNG Export Terminal and MOF

2.0 SEDIMENTS IN PORT ARTHUR CANAL

The site is located in the Port Arthur Canal (Figure 1-1), which is part of the Sabine-Neches Waterway (SNWW). The SNWW is a man-made navigation channel which extends from Gulf of Mexico through a jettied channel downstream of Port Arthur, to Beaumont via the Neches River Channel, and to Orange via the north part of Sabine Lake and continues via the Sabine River Channel.

Sedimentation in the SNWW is largely due to contributions from Sabine and Neches rivers, which empty into the Sabine-Neches estuary (Ravichandran et al., 1995). In order to evaluate sediment deposition rates in the Port Arthur Canal, an analysis of the historical dredging records was performed. The US Army Corps of Engineers (USACE) Navigation Data Center (NDC) maintains records of every awarded dredging contract from October 1, 1999 to September 30, 2013. Each record contains a summary of the dredging contract such as dates of bid advertisement, opening and contract award, estimated and actual start and end dates of dredging activity, estimated and actual dredged quantities. The NDC records listed eight awarded dredging contracts for the Port Arthur Canal. These records were used to obtain sedimentation rates. The extent of the area included in the sedimentation rate estimation is shown in Figure 2-1.

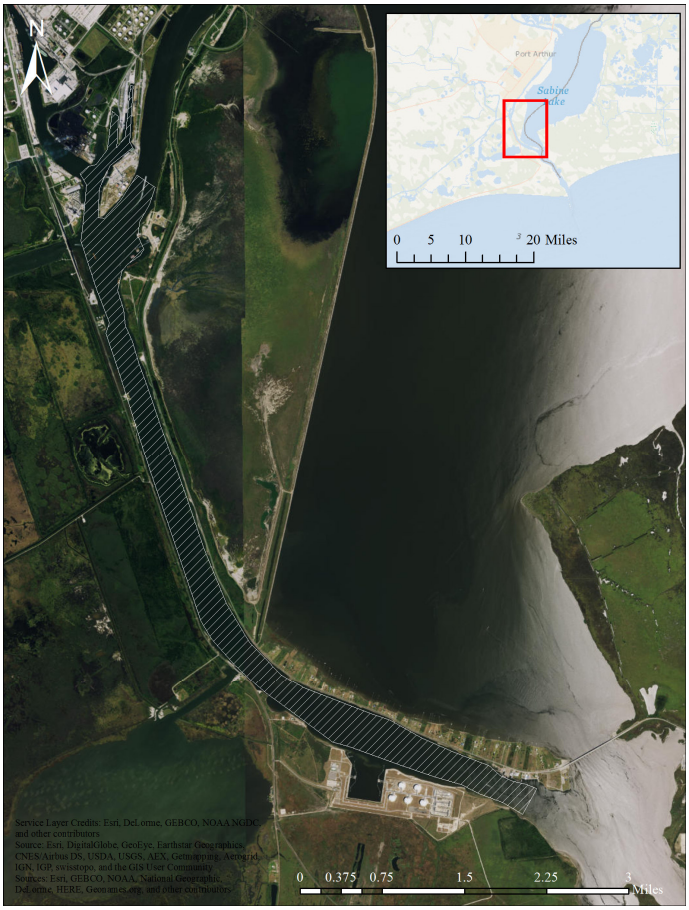

Figure 2-1: Channel area considered for sedimentation rate estimation

Table 2-1 consists of a summary of historical dredge activity in the Port Arthur Canal and Table 2-2 provides the sedimentation rate estimated using dredge volumes and time periods listed in Table 2-1.

3.0 SEDIMENTATION MODEL

3.1 Model Development

A two-dimensional sediment transport model was developed using Delf3D to estimate sedimentation rates in the LNG export berths, turning circle and MOF.

3.1.1 Model Grid and Bathymetry

The model domain includes a section of the Port Arthur Canal along with the dredged slip for LNG export berths and MOF. The model bathymetry was constructed from channel survey data provided by Chris Ransome & Associates, Inc. (CRA) and dredging configuration provided by the Owner. The grid cell size was varied throughout the domain. At the LNG export berths, the resolution was approximately 30 meters, and at MOF the resolution was approximately 10 meters.

All bathymetry data was referenced to Mean Sea Level (MSL). The local model grid is shown in Figure 3-1 and the bathymetry is shown in Figure 3-2.

Figure 3-1: Model grid

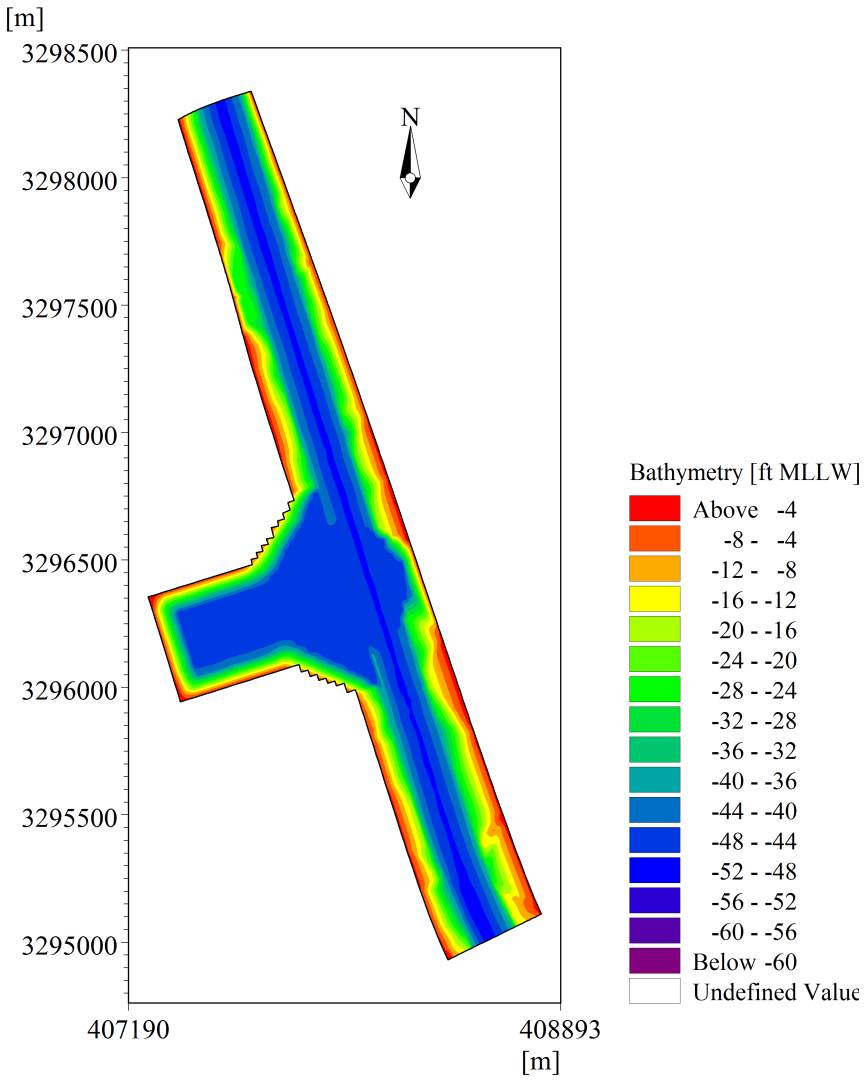

Figure 3-2: Model bathymetry

3.1.2 Boundary Conditions

The sedimentation model required boundary conditions for both hydrodynamic and sediment transport modules.

Hydrodynamic Boundary Conditions

Water levels and discharges extracted from the calibrated regional hydrodynamic model were used as hydrodynamic boundary conditions. Development of the regional hydrodynamic model is described in Hydrodynamic Modeling Report (9177-01RP0001 M&N, 2016).

Sediment Transport Boundary Conditions

The sediment transport model required specification of suspended sediment concentration at the boundaries. The Texas Commission on Environmental Quality (TCEQ) provides measured suspended sediment concentration (SSC) data for Sabine Lake. The data can be accessed from http://www80.tceq.texas.gov/SwqmisWeb/public/crpweb.faces. Data for Port Arthur Canal is available at different times between years 1971 and 2015, and from 11 different station locations. The available data had minimum and maximum SSC of 6 mg/l and 111 mg/l, respectively. 22 mg/l was the mean SSC in Port Arthur Canal.

3.2 Model Calibration

The model was calibrated using a simulation of a one month period, from October 9 to November 10, 2007. The aforementioned time period was selected because the same time period was used in the hydrodynamic model (M&N, 2016), whose results are being used here as hydrodynamic boundary conditions. Annual sedimentation rates in the model domain were calculated using the sediment transport module. In order to obtain annual sedimentation rate from one month's simulation, a morphological factor of 12 was used. This means that the bed thickness change over the one month of simulation would actually represent the bed thickness change during a 12-month period.

The mean sedimentation rate in the part of the mesh with Port Arthur Canal was computed and compared to the data available from historical dredge records. Figure 3-3 shows the channel region where resulting mean sedimentation rate was calculated from sedimentation model results.

Figure 3-3: Area used to calculate sedimentation rate in Port Arthur Canal

Distribution and variation of tidal currents and resulting bed shear stresses during a normal tidal cycle were analyzed to determine the critical shear stress parameters for erosion and deposition. The suspended sediment concentration specified at the boundary was used as the main calibration parameter. The sediment properties used in the model are presented in Table 3-1.

Table 3-1: Sediment properties

Sediment property	Value
Dry bed density (kg/m^3)	400
Settling velocity saline water (mm/s)	0.3†
Critical bed shear stress for erosion (N/m^2)	0.2
Critical bed shear stress for sedimentation (N/m^2)	0.1
Erosion parameter ($kg/m^2/s$)	7.0×10^{-6}

† Additional values were used in sensitivity tests

From the historical dredge records, the expected mean sedimentation rate was determined to be 0.72 ft/yr. Table 3-2 shows that the modeled mean sedimentation rate is in good agreement with the expected sedimentation rate obtained from historical dredge records.

The suspended sediment concentration value selected in Section 3.1.2 was modified to achieve the expected mean sedimentation rate in the channel.

Table 3-2: Comparison of annual sedimentation rate in Port Arthur Canal for calibration model runs

Case ID	Suspended sediment concentration (mg/l)	Expected mean sedimentation rate (ft/yr)	Achieved mean sedimentation rate (ft/yr)	Remarks
set01.c03	22	0.72	0.33	Initial calibration run
set01.c04	46	0.72	0.72	Final calibration run with updated suspended sediment concentration

3.3 Sedimentation at LNG Export Berths and MOF

The sedimentation rates at LNG export berths, turning circle and MOF were calculated using the results obtained from the calibrated sedimentation model. Figure 3-4 shows the polygons used for the three areas of interest. The sediment deposition volumes and rates were calculated for a given area considering only elements with positive net accumulation. The results are presented in Table 3-3.

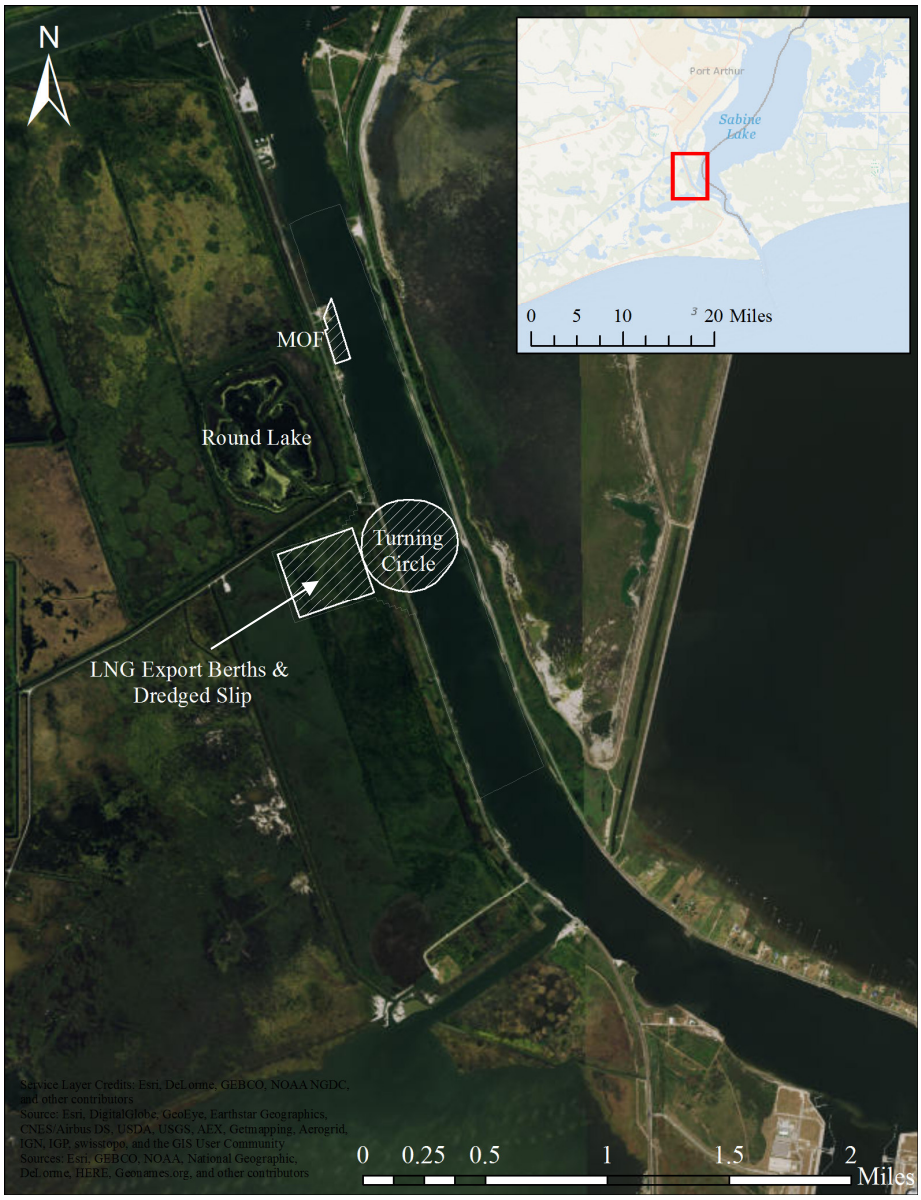

Figure 3-4: Areas used to calculate sedimentation rates at LNG Export Terminal and MOF

Table 3-3: Summary of sedimentation model results

Project area	Area (sq. yd)	Annual sediment deposition volume (cu. yd)	Annual sedimentation rate (ft)
LNG Export Berths & Dredged Slip	203,245	145,557	2.15
Turning Circle	272,650	128,222	1.41
MOF	33,350	12,914	1.16

Figure 3-5 shows the variation of annual sedimentation rates over different areas of interest.

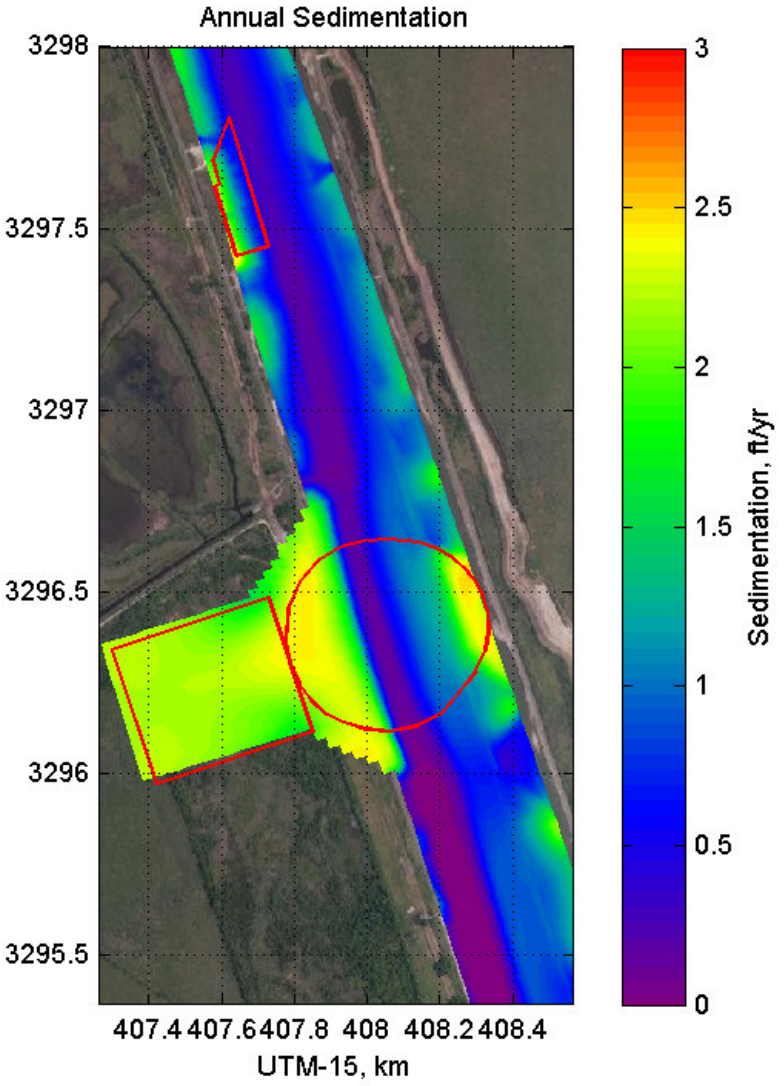

Figure 3-5: Spatial variation in annual sedimentation rates calculated from model results

From Table 3-3, it can be seen that the LNG Export Terminal exhibits a higher sedimentation rate, 2.3 ft/yr, than other areas which are in the Port Arthur Canal (1.3–1.5 ft/yr). It was seen from the results of local hydrodynamic model (M&N, 2016), that there is significant eddy formation inside the LNG Export Terminal during flood and ebb tides. Figure 3-6 shows the current speeds in the vicinity of the LNG Export Terminal during flood and ebb tides.

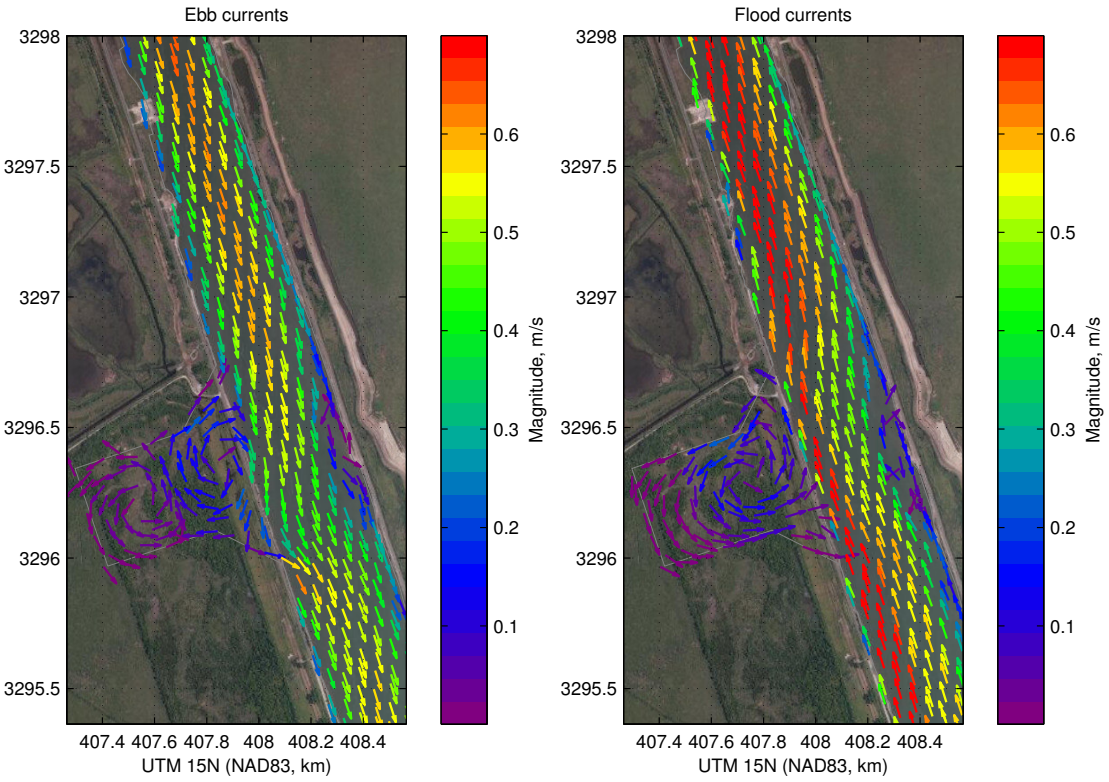

Figure 3-6: Current field in Port Arthur Canal during ebb and flood tide

This would normally result in increased sedimentation. The eddies tend to bring more suspended sediments in the dredge basin due to longer retention times and lower current speeds inside the LNG Export Terminal, which promotes sediment settling and increased sedimentation.

4.0 SENSITIVITY ANALYSIS ON MODEL PARAMETER: SETTLING VELOCITY

The settling velocity of sediment is one of the key sediment transport model parameters. It depends on various physical and environmental factors. It is difficult to accurately measure settling velocity, especially for cohesive sediments as it is likely to vary between different locations and in time.

In this study, a constant settling velocity of 0.3 mm/s was used. Zaloom et al (2003) and found that sediments in Sabine Lake have settling velocity between 0.1 mm/s and 0.35 mm/s, calculated from various samples. Other modeling studies conducted for coastal areas near Gulf of Mexico, assume settling velocity to be between 0.1 mm/s and 0.5 mm/s (ACRE, 2010; Su et al., 2007).

A sensitivity analysis was conducted to determine the effect of change in settling velocity on the annual sediment deposition rates.

The sedimentation model described in Section 3.0 was run with the settling velocity parameter set to 0.1 and 0.4 mm/s. The suspended sediment concentration value used as boundary condition was varied such that a mean sedimentation rate of 0.72 ft/yr was achieved in the Port Arthur Canal in both cases. Table 4-1 summarizes the model results obtained from the sensitivity runs.

Table 4-1: Summary of model sensitivity runs

Settling velocity (mm/s)	Suspended sediment concentration (mg/l)	Annual sedimentation rate (ft/yr)		
		LNG Export Berths & Dredged Slip	Turning Circle	MOF
0.1	120	2.46	1.48	1.14
0.3	46	2.15	1.41	1.16
0.4	36	1.99	1.36	1.15

Figure 4-1 shows the change in distribution of sediment deposition rates for the three cases examined in the model sensitivity runs. It can be seen from Figure 4-1 that a lower settling velocity leads to a higher sedimentation in the LNG berth slip.

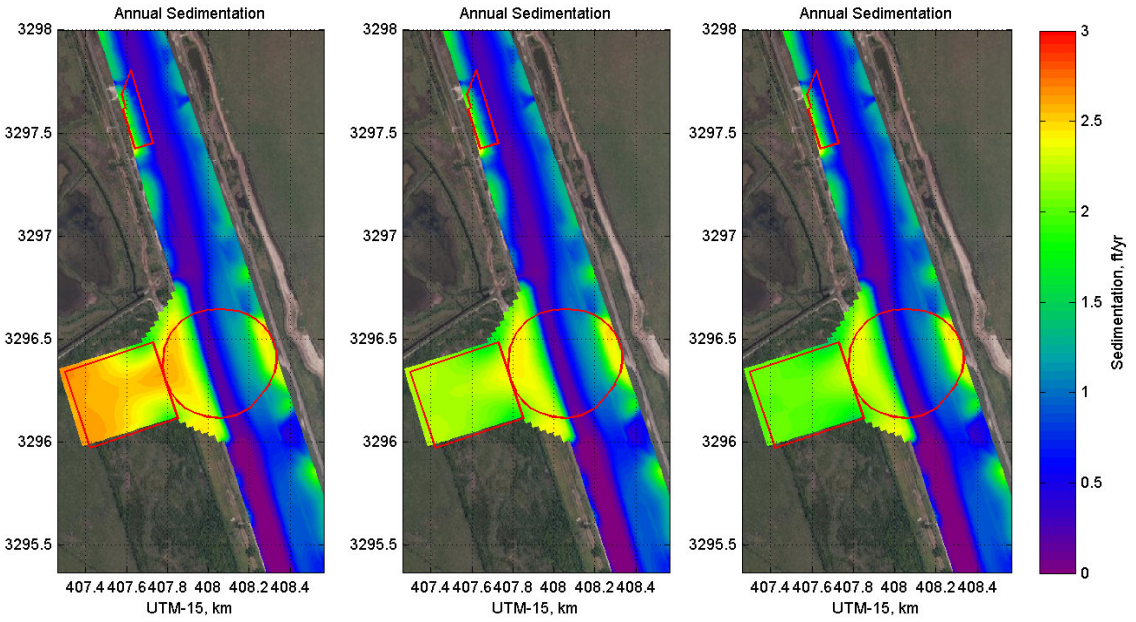

Figure 4-1: Spatial variation in annual sedimentation rates calculated for three different settling velocities (Left–0.1 mm/s, Middle–0.3 mm/s, Right–0.4 mm/s)

Table 4-1 shows that the sedimentation rates increase by a maximum of 15%, when settling velocity of 0.1 mm/s is assumed. It is to be noted that the suspended sediment concentration (SSC) used as boundary condition for settling velocity of 0.1 mm/s was 120 mg/l. It is at the upper range of values measured by TCEQ. Such a high SSC may not represent average conditions.

For settling velocity of 0.4 mm/s the resulting SSC is 36 mg/l, which is a closer value to the mean SSC calculated from TCEQ data. The pattern of sediment deposition seen in Figure 4-1 suggests that more sediments are accumulated at the entrance of the LNG berth slip.

Therefore, while the sedimentation rate estimates calculated using 0.3 mm/s settling velocity can be considered to represent average conditions, it is possible that in any given year, an increase in sedimentation of up to 15% can be expected. This is due to natural variations that can occur in suspended sediment concentration and in sediment characteristics in the navigation channel.

5.0 CONCLUSIONS

A Delft3D sediment transport model was developed to simulate sedimentation in the Port Arthur Canal and to estimate sediment deposition rates in the LNG Export Terminal and MOF. The model was calibrated to match sedimentation rates calculated in the Port Arthur Canal using historical dredge records.

The calibrated sediment transport model was run from October 9, 2007 to November 10, 2007 to evaluate net deposition at the project site. Change in sediment thickness was extracted from the model results and expected annual deposition was calculated. Expected annual sediment deposition volumes estimated in different portions of the project site are summarized in Table 5-1.

Table 5-1: Summary of sedimentation model results

Project area	Area (sq. yd)	Annual sediment deposition volume (cu. yd)	Annual sedimentation rate (ft)
LNG Export Berths & Dredged Slip	203,245	145,557	2.15
Turning Circle	272,650	128,222	1.41
MOF	33,350	12,914	1.16

It can be seen that the LNG Export Terminal exhibits a higher sedimentation rate, 2.15 ft/yr, than other project areas which are in the Port Arthur Canal (1.16–1.41 ft/yr). It was seen from the local hydrodynamic model results that there is significant eddy formation inside the LNG Export Terminal during flood and ebb tides. The eddies tend to carry more suspended sediments, and once the current speeds reduce inside the LNG Export Terminal, the sediments start to settle causing the increased sedimentation.

1 INTRODUCTION

The Basic Engineering Design Data (BEDD) document is intended to supply the information required to proceed with the engineering design work for the project. This document also refers to various resource documents for specific engineering details that may not be covered in the BEDD.

2 OVERVIEW

2.1 Project Overview

The Port Arthur LNG Facility is to be located on a tract of land owned by an affiliate of Port Arthur LNG, LLC on the Sabine-Neches Waterway as shown in Figure 1 below. The property has water front adjacent to the Gulf of Mexico and the Intracoastal Waterway.

Figure 1: Rendering of Port Arthur LNG Facility

3 METEOROLOGICAL AND GENERAL DESIGN DATA

3.1 Site Description / Location

The proposed site elevation (high point) for the LNG Facility will be +7.0 feet NAVD88 for the Process Area and the LNG tanks.

3.2 Coordinate System

Site Coordinates:

Horizontal dimensional control shall be based on U.S. State Plane Coordinate System, Lambert Projection, NAD83, Texas south central zone, U.S. survey foot.

All vertical dimensional control is based on North American Vertical Datum 1988 (NAVD88)

High Point of Finished Surface (HPFS) elevation = North American Vertical Datum 1988 (NAVD88) elevation +7'-0" ~~NAVD88 elevation = Mean Sea Level (MSL) +0.59 ft.~~

PALNG plant coordinate system originates from TPWD monument located at 29* 47' 52.61" N and 93* 57' 15.07" W. Plant coordinates N. 20,000'-0" and E. 10,000'-0" are equal to Texas state plane coordinates N. 13,872,197.79 ft and E. 3,568,342.28 ft.

Plant North is rotated 22º west of Grid North

3.3 Water Level

Description	Datum	Value, ft (Epoch: 1983 –2001)
Mean Higher High Water	MHHW	1.23
Mean High Water	MHW	1.13
Mean Sea Level	MSL	0.59
Mean Low Water	MLW	0.04
National Geodetic Vertical Datum of 1929	NGVD29	0.04
North American Vertical Datum 1988	NAVD88	0.00
Mean Lower Low Water	MLLW	-0.37
Mean Low Tide	MLT	-0.94
Mean Low Gulf	MLG	-1.49
Mean Tidal Range (MHW – MLW)	MN	1.09

3.4 Wind

The wind analysis was performed using twenty years (1996 to 2015) of historical data from the Jack Brooks Reginal Airport (formerly the Southeast Texas Regional Airport) weather station, which is located 12 miles northwest of the LNG Facility. The wind rose is presented in Figure below, this figure shall be applied to the project site by referencing North (True North)

in the figure to Grid north which is 2º-28' West of True North.

Wind Rose

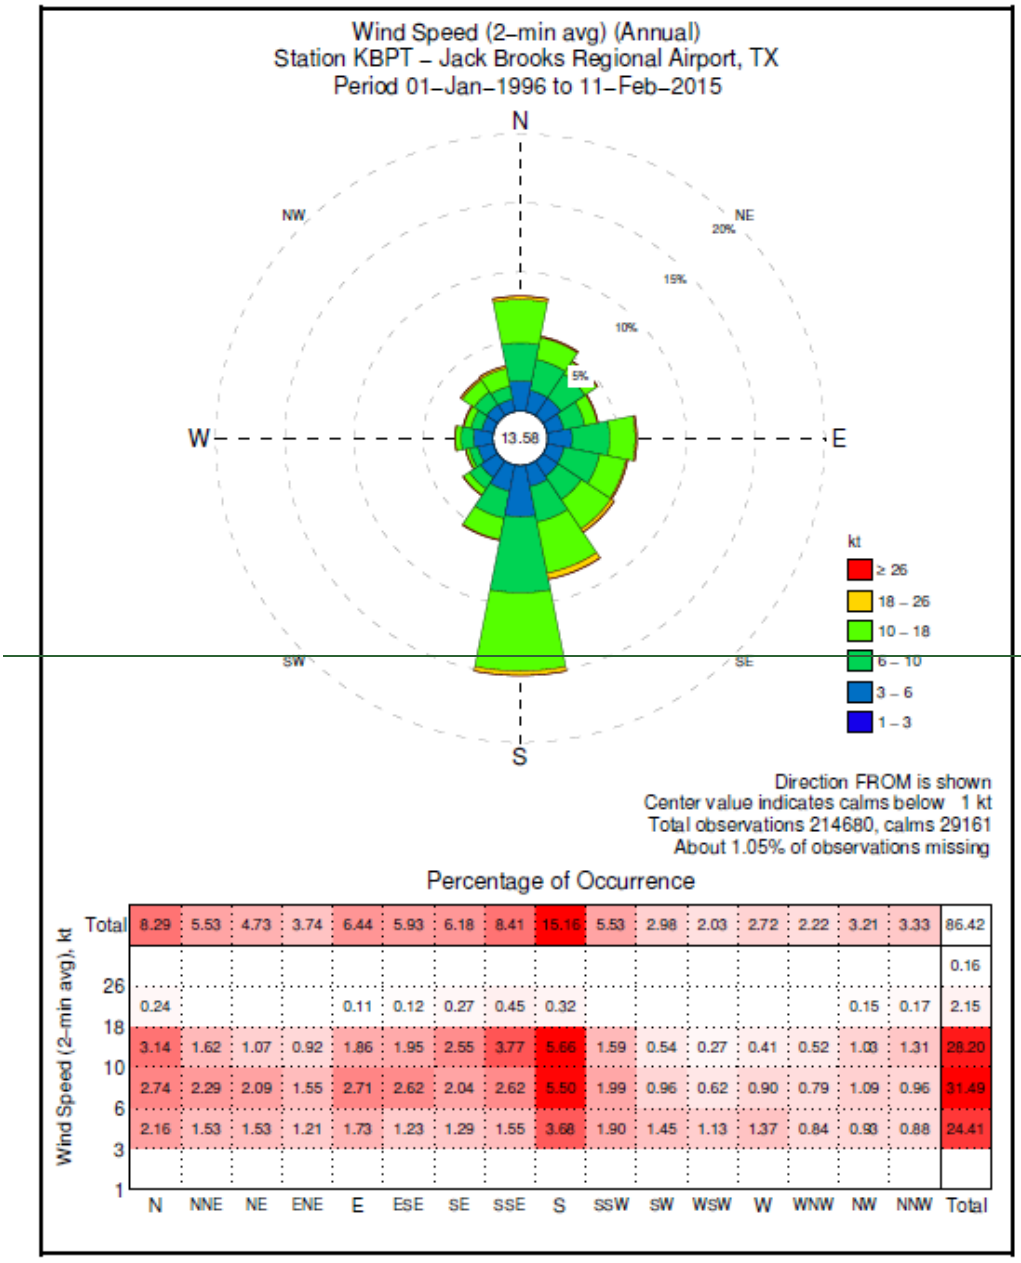

Figure 3-6: Annual wind rose for Station KBPT Jack Brooks Regional Airport

The design wind speed for the project, unless otherwise specified, shall be 190 mph for 3-second gust at 33 ft above grade using ASCE 7-10, which satisfies and exceeds the requirement of 150 mph sustained wind speed from 49 CFR PART 193 under section

193.2067 unless otherwise specified in the table below:

Structure	Risk Category (for Wind only) per ASCE 7-10	Basic Wind Speed (3-s gust speed) per ASCE 7-10
Security Fences (including access door and gates), Vapor Fences, Light Poles, CCTV Poles, Signs	I	135 mph

3.5 Snowfall

Snow loading design for structures shall be 0 psf.

3.6 Icing

Atmospheric ice loading shall be per ASCE 7-10.

3.7 Depth Averaged Currents

Depth-averaged currents near the site were calculated by Halcrow HPA from field measurements extending over an 11-month period in the Port Arthur Canal (Current Survey Study, 2007). Under normal conditions, the maximum depth-averaged ebb and flood currents were 3.2 knots and 2.6 knots, respectively.

3.8 Waves

The site is exposed to wind-generated waves and passing vessel-generated waves.

Wind-generated waves calculated with 100-year ASCE wind speed of 128.4 mph (3-sec gust at 33 ft above the ground) and a 100-year FEMA water level of +10.2 ft. (NAVD88) resulted in a maximum of 4.8 ft. significant wave height and 3.8 s peak wave period.

Wind-generated waves calculated with 500-year wind speed of 157 mph (sustained, using winds from NOAA Station SRST2 Sabine, TX) and a 500-year FEMA water level of 14.0 ft (NAVD88), resulted in maximum of 5.9 ft significant wave height and 4.0 s peak wave period.

Primary and secondary passing-vessel generated waves were examined for the design of shore protection. In the existing channel, a 40-ft draft vessel traveling at a speed of 12 knots can generate a primary or transverse stern wave height at the site in the range of 3.2 to 7.4 ft. Deep draft vessels are anticipated to navigate past the Project site at speeds of 6 to 7 knots (Sabine Pilots Association), thus lower transverse stern waves can be expected. Secondary waves, including those generated by tugs, can range from 1.2 to 1.6 ft.

3.8.1 Levee Elevation

The LNG Facility will be protected from storm surge inundation by a perimeter earthen levee designed to provide a 500-year return period standard of protection. This equates to a seawall levee height of +20.6 ft. (NAVD88) around the liquefaction site.

3.9 Site Ambient Temperatures

Site Ambient Temperature Data

Parameter	Temperature (ºF)
Annual Average	69.08
Annual Median	70.0
Extreme Low	14
Extreme High	104.0
2% Exceedance	39.0
98% Exceedance	92.0

Design Ambient Temperature

Case	Average	Hot	Cold
Designation	**AA**	**HA**	**CA**
Ambient Temperature (ºF, Note 1)	70.0	92.0	39.0
Gas Turbines Inlet Temperatures (ºF, Note 2)	73.6	95.6	42.6
Air Coolers Inlet Temperatures (ºF, Note 2)	73.6	95.6	42.6
Maximum Design Metal Temperature (insulated pipe) (ºF)	93		
Maximum Design Metal Temperature (un-insulated pipe) (ºF)	150		
Mechanical Design Maximum Temperature (ºF)	104		
Mechanical Design Minimum Temperature (ºF)	14		
Electrical Design Maximum Temperature (ºF)	104		
Electrical Design Minimum Temperature (ºF)	14		

Notes:

1. Does not include additional margins for global warming.
2. Includes a 3.6ºF hot air recirculation margin for gas turbines and 3.6ºF for air coolers, subject to studies to be conducted in the next phase of the project.

3.10 Barometric Pressure

Average barometric pressure at sea level of 14.696 psia
Minimum barometric pressure at sea level of 12.795 psia
Maximum barometric pressure at sea level of 15.722 psia
For design purposes, the standard atmospheric pressure of 14.696 psia shall be used
Barometric pressure rise and fall is 0.145~~580~~ psi/hr.

3.11 Relative Humidity

The relative humidity data to be used for design are as follows:

Air blower design shall use 100% relative humidity at 92 °F dry bulb temperature.

Gas Turbine Frame 7EA design is based on 80% relative humidity for all ambient temperature.

3.12 Rainfall Intensity

NOAA Atlas 14 (Texas 2018) rainfall frequency and depth shall be used in all drainage design.

3.12.1 Intensity

10-year ARI storm = 3.38 inches/hr.
25-year ARI storm = 4.05 inches/hr.
50-year ARI storm = 4.54 inches/hr.
100-year ARI storm = 5.07 inches/hr.
500-year ARI storm = 6.58 inches/hr.

3.12.2 Depth

25-year ARI storm, Maximum 24-hour rainfall = 12.4 inches
100-year ARI storm, Maximum 24-hour rainfall = 18.4 inches
Annual Mean Precipitation = 57.2 inches

3.12.3 Drainage Design

- Rational or any other approved equal method, or software may be used to calculate the peak run-off.
- See Section 7.0 for drainage design philosophy.

Note: The data above shall only be used for the plant permanent drainage system design. For drainage during the construction, the EPC contractor may use the above data, however, they shall be solely responsible for those events and use more severe events should it be required/justified.

3.13 Seismic Data

For the analysis and design of LNG tanks and their foundations classified as Seismic Category I (SC-I) as defined in FERC Draft Seismic Design Guidelines and Data Submittal Requirements for LNG Facilities, January 23, 2007 for LNG Facilities, Part I, Section 2 and 3, seismic loading shall be determined in accordance with NFPA 59A-2006 using two levels of earthquake motions – the Operating Basis Earthquake (OBE) and the Safe Shutdown Earthquake (SSE), and using the following site specific spectral response accelerations:

Safe Shutdown Earthquake (SSE): 5% damped, spectral response accelerations per Table 7.2-1 of Fugro report No. 04.10150037-2.

Operating Basis Earthquake (OBE): 5% damped, spectral response accelerations per Table 7.2-2 of Fugro report No. 04.10150037-2.

For seismic design of LNG Tank associated Pressure Safety Valves, Vacuum Relief Valves, platforms and other appurtenances physically attached to the LNG Tanks, the amplified spectral accelerations acting at the structure/component point of support elevation on the tank shall be used.

For the analysis and design of structures, components and systems other than LNG tanks and their foundations, seismic loading shall be determined in accordance with ASCE 7-10.

Seismic design parameters are as follows:

- Site Class E
- Risk Category (for seismic only) III
- Seismic Design Category B
- Design Spectral Response Accelerations:

SDS = 0.164 (per Fugro report No. 04.10150037-2)

SD1 = 0.118 (per Fugro report No. 04.10150037-2)

SMS = 0.247 (per Fugro report No. 04.10150037-2)

SM1 = 0.177 (per Fugro report No. 04.10150037-2)

- Seismic Importance Factors, I_e = 1.25 & I_p = 1.50

3.14 Facilities Design Life

The LNG Facility will be designed for a Design Life of 25 years. The LNG Facility will have a preventative/predictive maintenance plan including corrosion control, taking into account the coastal environment, to maintain this design life.

Item	
Design Life Major vessels and equipment and major structural internals	25 Years 25 Years
Vessel internals	25 Years
Fired heater tubes	25 Years
Shell and tube heat exchangers tubes	25 Years
Critical piping and piping > 4-inch diameter	25 Years
Other piping	25 Years
Marine Facilities- LNG Berths and Material Offloading Facility	25 Years

4 UTILITIES

4.1 Utility & Instrument Air

Parameter	Utility Air	Instrument Air
Maximum Dew Point °F (°C)	Not applicable	-40°F (-40°C)
Operating Pressure (psig)	80-125	80-125
Operating Temperature (°F)	Ambient	Ambient
Entrainment [1]	Oil free	Clean, dry & oil free

4.2 Nitrogen

Products	Pressure (psig)	Temperature (°F)
Nitrogen to Distribution Header	125 psig	Ambient 70°F

4.3 Potable Water Battery Limit Conditions

Parameter	Unit	City (Potable) Water
Operating Pressure	psig	60
Operating Temperature	°F	Ground temperature

5 ELECTRICAL

The distribution and utilization voltages will be as follows:

Primary Distribution – 34.5 kV, 13.8 kV, 4160 V 3-phase, 3-wire, low resistance grounded neutral.

Secondary Distribution - 480 V, 3-phase, 3-wire, solidly grounded neutral or high resistance grounded neutral.

5.1 VOLTAGE LEVELS

Voltage levels for general electrical loads

Load	Voltage
Street and flood lighting	208 V or 480 V, 1Ø
Welding outlets	480 V, 3Ø
Process unit and indoor lighting	120 V, 1Ø
Convenience outlets	120 V, 1Ø
Instrument devices	120 V, 1Ø

Voltage levels for motor loads

Horsepower Rating	Voltage
< 1/2~~3~~ HP	120 V, 1Ø
~~½~~ 3/4 HP to 200 HP	480 V, 3Ø *
201 HP to 3000 HP	4.0 KV, 3Ø **
3001 HP ~~and above~~to 5000HP	4.0 or 13.2 KV, 3Ø ***
5001 HP and above	13.2 KV, 3Ø ***

Consideration may be given to special cases where motors of certain ratings may be of a different voltage to that specified above (e.g. where a particular voltage is not locally available, or its capacity is limited). VFD driven motors higher than 200HP shall be three-phase single or two~~2~~ winding with the voltage as specified by the vendor.

6 EFFLUENT DISCHARGE

Wastewater will be collected into two wastewater tanks and taken out for off-site disposal using a licensed contractor. Sanitary wastewater will be routed to a lift station provided by the City of Port Arthur and then routed to a municipal treatment facility for disposal.

7 STORMWATER DRAINAGE PHILOSOPHY

The Storm water runoff shall be discharged by pumping over the flood protection berm without negatively impacting the performance of the equipment:

a) All non-critical equipment point of support (POS) shall be at or above the flood elevation from a 500-year ARI storm, with all pumps running.

b) All critical equipment POS shall be at or above the flood elevation during a 100-year ARI 7-day extended period storm, considering overtopping and pumps not running.

The overtopping of the berm shall be considered, during a 500-year storm event, for the berm section facing the Sabine waterway. The overtopping rate of 0.10 cfs per foot length of berm, for a maximum period of 2-hours, shall be used in the evaluation.

The storm water conveyance channel shall be designed to carry the peak flow from a 10-year ARI storm event with pumps running.

8 PROJECT UNITS

The system of measurements shall be U.S. Customary Units for the following:

- Pressure: psia, psig
- Temperature: deg F
- Weights: lbs
- Length: ft.
- Mass Flow Rate: lb./hr.
- Mole flow rate: lb.-mol/hr.
- Molecular weight: lb./lb mol
- Mass density: lb./ft3
- Volume: ft3
- Velocity: ft./sec
- Line Size: inches
- Thermal Energy: Btu/hr.
- Electrical Energy: MW, kW
- Mechanical Power: HP

9 GEOTECHNICAL DATA

A geotechnical investigation was carried out by Fugro USA Land, Inc. (Fugro) under subcontract to Port Arthur LNG, LLC. Refer to the Fugro Report No. 04.10150037 for more details of the site conditions and subsurface conditions. Supplemental geotechnical investigation has been conducted in 2019, and the factual data are provided in the Fugro Report No. 04.10180165-1 as EPC-level geotechnical data report for the entire LNG development~~Onshore LNG Liquefaction Facilities and the Fugro Report No. 04.1018065-2 for Nearshore Facilities~~.

1.0 GENERAL

1.1 Scope

1.1.1 This document establishes minimum civil engineering requirements for site development including but not limited to, design of roads, railroads, paving, drainage, stormwater control, erosion and sediment controls and fencing and gates. This document shall be used for design and preparation of construction documents and is not intended for use as a construction specification.

1.2 Abbreviations

1.2.1 Abbreviations used in this document shall have the following definitions:

AASHTO	American Association of State Highway and Transportation Officials
ACI	American Concrete Institute
AI	Asphalt Institute
AISI	American Iron and Steel Institute
ASTM	ASTM International
CLFMI	Chain Link Fence Manufacturers Institute
FHWA	Federal Highway Administration
MUTCD	Manual on Uniform Traffic Control Devices
NAAMM	National Association of Architectural Metal Manufacturers
NFPA	National Fire Protection Association
PCA	Portland Cement Association

1.3 Definitions

1.3.1 The following words shall have these special meanings when used herein:

Access Roads	Plant area roads that provide occasional access to areas for maintenance, security and firefighting vehicles. Access roads may or may not be paved.
Average Recurrence Interval (ARI)	Probability of a rainfall event of defined characteristics occurring in any given year at a given location.
Base Course	A layer of well-graded granular material that supports the paving and distributes wheel loads over a greater area of the subgrade.
Building Zone	The area enclosed within a 5-foot offset from the exterior cladding.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

Clear Zone	A traversable and unobstructed area beyond the edge of the travelway.
Flood Hazard Area	The area within a flood plain subject to a 1-percent or greater chance of flooding in any year. The area designated as a flood hazard area on a community's flood hazard map, or otherwise legally designated.
Freeboard	The vertical distance between the calculated water surface elevation and the top, crest of a structure or the floor level of a building.
Geogrid	High tensile strength polymer gridded material that provide a mechanism for interlocking aggregate material placed on the geogrid to prevent lateral movement and improve load distribution to the subgrade.
Geotextile Fabric	A flexible, porous textile which is commonly placed between dissimilar materials so that the integrity and functioning of both materials can remain intact or improved.
Lane	Portion of the travelway intended for a single line of traffic in a given direction.
Owner	Provide Entity Name or Owner of the Plant.
Paved Surface	Reinforced concrete or bituminous surfacing.
Primary Road	Plant area road that provides access to product shipping and receiving points used by large trucks and cranes.
Roadway	Structural section inclusive of travelway and shoulders.
Secondary Roads	Plant area roads that provide access to equipment by maintenance equipment and personnel vehicles not including cranes.
shall	Indicates that the statement is mandatory
should	Indicates a recommendation
Shoulder	Portion of the roadway structure that lies outside of the travelway, subject to intermittent traffic. Shoulder can be paved or unpaved.
Structural Flooding	The water surface elevation from the storm event exceeds the top of slab elevation of the building resulting in water entering the structure.
Subbase	A compacted layer of well-graded fill that may be required under the base course. Typically provided over fine grained subgrade soils to improve drainage, resist frost heave, provide structural support by distributing loads, and to prevent pumping of finer grained soils into the base material at paving joints and edges.
Subgrade	Soil placed and/or compacted during the rough grading works. Typically consists of natural soils found on site, unless soil strength is inadequate and imported soils are required.
Surface Waters	Natural waters such as in a stream, river, lake, wetland, or ocean. Stormwater facilities are not considered surface waters.

2.0 SITE DEVELOPMENT

2.1 Existing Site Conditions

2.1.1 Current site topographic survey conducted for the project or as approved by the project shall be used to define existing site conditions. This topography shall form the basis of all earthwork calculations.

2.1.2 For geotechnical recommendations and subsurface conditions, refer to 26196-100-3DR-K04F-00001, EDSA Geotechnical Design Basis Report and 26196-100-3DR-K04F-00002, EDSA Geotechnical Recommendation for Site Preparation and Ground Improvement.

2.1.3 For special requirements related to environmental conditions, refer to Environmental Design Basis.

2.2 Site Preparation and Grading

2.2.1 For material requirements, refer to 26196-100-3PS-CG00-00001, Project Specification for Site Preparation and Earthwork.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

2.2.2 Site shall be graded to provide positive drainage and prevent ponding. Specific attention shall be made to areas around at-grade or above-grade structures to ensure structures do not block flow paths and trap water.

2.2.3 Finished grades shall be in accordance with Table 1, Finished Grades.

Table 1: Finished Grades

Item / Area Description	Requirement
Process Areas – Flammable/Cryogenic Liquid[1]	Min. 1.0%
Process / Utility Areas	Min. 0.5%
Non-Process Areas	Min. 0.3%
Tank Areas - Flammable Liquid[1]	Min. 1.0%
Primary Road – Longitudinal[2]	Min. 0.5% Max. 5.0%
Primary Road – Transverse	Min. 2.0%
Secondary Road Longitudinal[2]	Min. 0.5% Max. 7.5%
Secondary Road – Transverse	Min. 2.0%
Access Roads	Max. 10%
Parking Areas	Min. 0.5% Max. 5.0%
Sidewalks – Longitudinal	Max. 5.0%
Sidewalks – Transverse	Max. 2.0%
Ditches – Longitudinal	Min. 0.10%

1. Required for minimum 50 ft. (15 m) from the edge of tank in accordance with NFPA 30.
2. Minimum slope required only where curbs or structures adjacent to roads obstruct drainage flows.

2.2.4 Finished grade elevation at buildings shall be a minimum of 8 in. below building finished floor elevation.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

2.2.5 Occupied buildings shall be protected from structural flooding from a 100 yr ARI storm.

2.2.6 Embankments shall be benched and protected as required to prevent erosion by wind and rain.

2.2.7 Where granular fills are required over soft subgrades, geotextiles shall be provided as required.

2.2.8 Subgrade improvement shall be identified on drawings as required by 26196-100-3DR-K04F-00001, EDSA Geotechnical Design Basis Report and 26196-100-3DR-K04F-00002, EDSA Geotechnical Recommendation for Site Preparation and Ground Improvement.

2.2.9 Site layout shall be coordinated with Plant Design & Piping and Electrical Engineering disciplines to provide required space for underground utilities, miscellaneous structures, and drainage features.

2.3 Erosion and Sediment Control

2.3.1 Erosion and sediment control measures shall be in accordance with local, state and federal regulations, and project specific permits.

2.3.2 The following temporary erosion and sediment controls shall be provided:

a) Perimeter sediment controls (silt fences) to protect areas that will receive stormwater from earthworks activities.

b) Stabilized exits (rock areas) to minimize sediment and mud track-out onto off-site facilities.

c) Inlet protection (sediment traps) for off-site drainage facilities.

d) Erosion and velocity dissipation devices (rock check dams) along the length of unfinished channels and at channel inlets and outlets.

2.3.3 Temporary sediment basins should be provided to control sediment from disturbed areas greater than 10 acres. Sediment basins shall be sized for the lesser of:

a) The runoff from a 2-year, 24-hour storm, or

b) 3,600 cu. ft. per acre of drained area.

2.3.4 Natural buffers or equivalent sediment control measures shall be provided when a surface water is located within 50 ft. of the disturbed area of the project.

2.4 Flood Hazard Areas

2.4.1 Project sites located in Flood Hazard Areas shall be designed in accordance with local, state and federal regulations, and project specific permits.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

2.5 Design of Roads

2.5.1 Geometric design of roads shall be in accordance with Table 2, Guide Documents for Road Design.

Table 2: Guide Documents for Road Design

Criteria	Guide Document
Plant area roads with ADT ≤ 400	AASHTO, Guidelines for Geometric Design of Very Low Volume Local Roads (ADT ≤ 400), for Urban Industrial/Commercial Classification and this section
Plant area roads with ADT > 400	AASHTO, A Policy on Geometric Design of Highways and Streets.
Public Roads	AASHTO, A Policy on Geometric Design of Highways and Streets.

2.5.2 Roadway design shall be in accordance with Table 3, Roadway Design Parameters.

Table 3: Roadway Design Parameters

Road Class	Max. Design Speed mph	Min. Width ft.	Min. Shoulder Width ft.	Min. Inside Radius ft.	Design Vehicle
Primary	30	20	5	45	WB-65 (WB-20)
Secondary	15	20	3	45	WB-65 (WB-20)
Service /Access	15	16	-	15[1]	SU (Single Unit)
Patrol	15	10	-	10	Pick-Up Truck / ATV
Heavy Haul	10	20	20	100	Module or Construction Vehicles

1. Design Engineer shall be responsible for coordinating with the Owner to make sure proper access is provided for required maintenance vehicles and safe operation.

2.5.3 Inside radius shall be measured from the edge of the travelway.

2.5.4 Road shoulders may be paved or unpaved. Road shoulders should be paved where frequent stopping of vehicles are expected along roads. Unpaved shoulders shall drain away from the road travelway.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

2.5.5 Where unpaved shoulders are provided, inside radius at intersections shall be increased or the intersection provided with paved offset and taper to accommodate off-tracking characteristics of the design vehicle.

2.5.6 See Table 1 for minimum and maximum grades for road and paved areas. Where the longitudinal algebraic difference in grade is greater than 3%, a vertical curve shall be provided.

2.5.7 The minimum length of vertical curve shall be 3 times the design speed in miles per hour.

2.5.8 Turning movements of vehicles larger than SU may be allowed to cross into the oncoming traffic lane.

2.5.9 Minimum horizontal and vertical clearances shall be as required in accordance with Table 3, 26196-100-3DR-P34D-00002, Piping Design and Layout Criteria.

2.5.10 Required vertical clearances shall be measured from the high point of the road cross section and maintained for 2 ft. beyond the roadway

2.5.11 A clear zone of at least 6 ft. should be provided along primary and secondary roadways where possible measured from the shoulder edge.

2.5.12 Fire apparatus access roads shall be provided within 150 ft. of all portions of the plant facility and all portions of the exterior walls of the first story of the buildings.

2.5.13 Dead-end fire apparatus access roads in excess of 150 ft. in length shall be provided with an approved area for turning around fire apparatus.

2.5.14 See Section 3.0 for road paving design requirements.

2.6 Earthen Dikes

Earthen dikes may be used for spill containment or flood protection.

2.6.1 Earthen dikes for spill containment shall meet the requirements of 26196-100-3BD-U04-00001, Spill Containment Design Basis established for the work.

2.6.2 Containment dike walls shall be designed to withstand a full hydrostatic head. Hydro-dynamic loads are not required to be considered.

2.6.3 Earthen dikes more than 3 ft. in height shall have a top width of not less than 2 ft.

2.6.4 Earthen dike slopes shall not be steeper than the angle of repose of the material of which the dike is constructed. Maximum side slope shall be 2(H):1(V), but grass-lined dikes shall not exceed 3(H):1(V) side slopes.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

2.6.5 Where dikes are provided for containment, the containment volume shall be 100% of the largest tank capacity, plus 18 in. freeboard (maximum recorded rainfall in 24 hrs of 17.8").

2.6.6 Spill containment area dike walls and floors will require a minimum impermeability (1×10^{-5} cm/sec) to prevent egress of contaminants from the containment area in the event of a leak, up to and including impermeable liners/membranes.

2.6.7 Erosion control shall be provided on both sides of the dike to prevent deterioration resulting from heavy rainfall or leakage of any contained tank.

2.6.8 At least one stairway shall be provided over the spill containment dikes.

2.6.9 Flood protection Levee (dike):

- Facility shall be protected by a perimeter earthen levee designed to withstand a 500-year return period storm surge event.
- Top of levee shall be at or above El. 20.6 feet.
- Overtopping flow of 0.10 cfs per ft. is expected during a 500 year storm surge.
- Earthen levee shall be designed to withstand a full hydrostatic head plus hydro-dynamic loads.
- Side slopes of the levee shall be 3(H):1(V). Inner side slopes of 2.5(H):1(V) may be used if permitted by the Geotech consultant.
- Side slopes of the levee shall be protected from erosion due to wind, rain and wave action.

2.7 Parking Areas

2.7.1 Typically 90° parking shall be used. Alternative parking geometries may be used only where space restrictions dictate their use.

2.7.2 Parking space and aisle dimensions shall be in accordance with typical parking area layout in 26196-100-C0-000-00016, Civil – Sitework Standard Drawing, Road Signage and Markings.

2.7.3 Minimum 6 ft. long wheel stops anchored to the pavement shall be provided at parking spaces adjacent to sidewalks, buildings, stormwater facilities, areas of extreme slope and other areas where a vehicle would cause property damage.

2.8 Signage and Markings

2.8.1 Signs and associated pavement markings to facilitate safe traffic movement shall be provided in accordance with the Manual on Uniform Traffic Control Devices (MUTCD).

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

2.8.2 Non-reflectorized pavement markings shall be provided for paved parking areas.

2.8.3 Reflectorized pavement markings shall be provided for paved roads and streets, and fire access markings.

2.9 Fencing

2.9.1 Fencing shall be chain link or welded wire mesh and meet the requirements of 26196-100-3PS-CY10-00001, Project Specification for Fencing and Gates, 26196-100-C0-000-00060, Civil - Sitework Standard Drawing, Chain-Link Fence Details, Sheet 1, 26196-100-C0-000-00061, Civil - Sitework Standard Drawing, Chain-Link Fence Details, Sheet 2, 26196-100-C0-000-00062, Civil - Sitework Standard Drawing, Chain-Link Fence Connection Details and 26196-100-C0-000-00063, Civil - Sitework Standard Drawing, Chain-Link Fence Gate Details.

2.9.2 Fencing shall have a maximum mesh size of 2 in. for chain link fencing and 4 sq. in. for welded mesh fencing.

2.9.3 Fencing shall be provided with continuous bottom rail and top tension wire.

2.9.4 Fencing post and spacing shall be determined in accordance with WLG 2445. A minimum of 135 miles per hour wind speed shall be considered in the fence and its foundation design.

2.9.5 Security barriers shall be provided at all locations where security fences must cross culverts, drainage ditches, swales or other openings larger than 100 sq. in.

2.9.6 Security fencing will consist of an 9 ft. high (8’ fence fabric height) perimeter fence equipped with triple barbed wire on 45-degree angled top and razor wire.

2.9.7 Intermediate posts shall be evenly spaced 10 ft. or less apart.

2.9.8 The thermal radiation zone (1500 Btu) for the flare should be provided with warning signage at regular intervals to prevent normal access to the area.

2.9.9 A clear distance of at least 10 ft. shall be maintained on the unsecure side of security fencing from any structures, ground or vegetation that rises above the fence grade.

2.9.10 Fencing for utility areas, laydown areas, etc. shall not be less than 6 ft. in height.

2.10 Guardrails and Bollards

2.10.1 Guardrails shall be provided along primary and secondary roads for the following situations:

a) Embankment:

- Heights is greater than 5 ft, and

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. (“BEINC”). All rights reserved.

- Slope is greater that 3H to 1V, and
- Within the roadway clear zone

b) An errant vehicle leaving the roadway can result in serious injury or damage to the facility.

2.10.2 Guardrails along Access Roads shall be evaluated on a case by case basis.

2.10.3 Embankment slopes of 4H to 1V are considered recoverable and no protection is required.

2.10.4 Guardrails should be provided wherever structures are within the clear zone of the roadway or could be subject to damage from incidental vehicular contact.

2.10.5 Bollards should be considered in low traffic areas where structures could be subject to damage from incidental vehicular contact.

3.0 PAVEMENT AND SURFACING

3.1 General

3.1.1 Pavement and surfacing shall be as required by Plant Design and Piping.

3.1.2 Minimum flexural strength of concrete for pavements shall be 600 psi at 28 days.

3.1.3 Minimum compressive strength of concrete for pavements, walkways, curbs and gutters shall be 4000 psi at 28 days.

3.1.4 Paving shall not be tied to building or equipment foundations.

3.1.5 Consideration for material management and economics shall be given to specification of gravel surfacing materials including crushed stone, rip rap and Armor Rock. Where technically acceptable these materials shall be paired down to minimize material types.

3.2 Road Pavement

3.2.1 Pavements shall be designed for a minimum service life of 20 years.

3.2.2 Primary and Secondary roads shall be designed for AASTHO HS-20 wheel load.

3.2.3 Design of flexible pavements shall be in accordance with AASHTO Guide for Design of Pavement Structures, or AI MS-1.

3.2.4 Design of rigid pavements shall be in accordance with AASHTO Guide for Design of Pavement Structures.

3.2.5 Average daily traffic shall be determined from available operational and maintenance information. Where information is not made available the design traffic shall be as follows:

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

a) ESAL = 800,000 total applications for Primary Roads

b) ESAL = 500,000 total applications for Secondary Roads

c) ESAL = 200,000 total applications for Access Roads.

3.2.6 Material properties for structural design, California Bearing Ratio (CBR), Resilient Modulus (MR) and Modulus of Subgrade Reaction (k-value) shall be as defined in 26196-100-3DR-K04F-00001, EDSA Geotechnical Design Basis Report.

3.2.7 Pavement design parameters shall be as follows:

a) Initial Serviceability = 4.5(rigid); 4.2 (flexible)

b) Terminal Serviceability = 2.0

c) Standard Deviation = 0.35(rigid); 0.45 (flexible)

d) Reliability (Min.) = 75%

3.2.8 Flexible pavement design shall include:

a) A minimum 8 in. thick granular base.

b) Geogrid, to reduce the required section of granular base where economical.

c) A subsurface drainage system shall be provided in accordance with Section 5.0, if required.

3.3 Concrete Area Paving

3.3.1 Area paving shall be designed in accordance with PCA, 1988, No. IS 234.01P, ACI-330R, ACI-302-1R or ACI-325.3R.

3.3.2 Area paving shall be designed for the anticipated operational and maintenance traffic loads and have minimum thicknesses in accordance with Table 4, Minimum Thickness for Area Paving.

Table 4: Minimum Thickness for Area Paving

Pavement Service	Minimum Thickness
Walkways	4 in.
Light Vehicles	6 in.
Heavy Vehicles / Cranes	8 in.

3.3.3 Pavement thickness shall be increased by 15% for free edge, excluding walkways.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

3.3.4 Distributed steel shall be provided to control shrinkage cracking in all concrete slabs and walkways.

3.3.5 Joints in concrete paving, including shrinkage dissipation joints (i.e. contraction joints, or control joints) shall be detailed and shown on design drawings. These joints shall not exceed 20 ft. spacing unless justified by specific design considerations.

3.3.6 Walkways shall have a minimum width of 4 ft. Maximum spacing for control joints shall be 10 ft.

3.3.7 Pavement joints shall be in accordance with ACI-224.3R-95, Joint in Concrete Construction.

3.3.8 For areas requiring curbs, curb height shall be min 10-in. or as required by the Spill Containment Design Basis.

3.3.9 Pavement construction shall be in accordance with ACI-325.9.

3.4 Bituminous Area Paving and Parking Areas

3.4.1 Paving shall meet the requirements for flexible pavements in Section 3.2

3.4.2 Determine average daily traffic from available operational and maintenance information. Where information is not made available, the design traffic shall be 250,000 ESAL's.

3.5 Compacted Crushed Rock with Surface Seal Areas

3.5.1 Compacted crush rock shall be base course material with a minimum thickness of 4 in.

3.5.2 Surface sealer (prime coat) shall be applied to surface of the compacted crush rock.

3.6 Gravel Surfaced Areas

3.6.1 Where required, gravel/crushed stone surfacing shall be provided to a minimum thickness of 3 in.

3.6.2 Geotextile fabric shall be installed to provide a separation layer between the gravel surfacing and subgrade, if required.

4.0 STORMWATER MANAGEMENT

4.1 General

4.1.1 Surface drainage, underground drainage systems, and stormwater management facilities shall be designed in accordance with local, state and federal regulations, and project specific permits.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

4.1.2 Systems may include features such as storm sewers, roadside ditches, trenches, open channels and detention ponds.

4.1.3 NOAA Atlas 14 (Texas 2018) rainfall frequency and depth shall be used in all drainage design

4.1.4 Facility shall be protected by a perimeter earthen dike/levee. As there is no gravity drainage outlet from the diked plant area, pumps will be required to remove stormwater.

4.1.5 The overtopping of levess shall be considered, during a 500-year storm event, for the levee section facing the Sabine waterway. The overtopping rate of 0.10 cfs per foot length of levee, for a maximum period of 2-hours, shall be used in the evaluation.

4.1.6 Permanent Plant stormwater drainage conveyance systems such as ditches, channels, trenches and culverts within the levee shall be designed for a minimum 10-year ARI storm, with pumps running.

4.1.7 Water surface for higher intensity storms shall be checked as follows:

a) All non-critical equipment point of support (POS) shall be at or above the high water elevation from a 500-year 24-hours ARI storm, with all pumps running.

b) All critical equipment POS shall be at or above the high water elevation during a 100-year ARI 7-day extended period storm, considering overtopping and pumps not running.

4.1.8 Overland flow and natural site features may be utilized where stormwater drainage will not impact site function. Drainage systems shall prevent erosion of existing soils, ponding, and convey flow to a suitable outfall location.

4.1.9 Design shall not increase or redirect existing sheet flow to adjacent private or public property.

4.1.10 Where possible the stormwater discharge from the developed site should be located coincident to the pre-developed discharge locations.

4.1.11 Stormwater discharge should be maintained as close as possible to the pre-developed discharge flows if discharging into county drainage facilities or public roadside ditches. Discharge flows cannot be increase without local authorities approval. Provide detention ponds, if required, to control stormwater discharge.

4.1.12 Surface water from non-operating areas shall generally be considered clean and allowed to be discharged without additional treatment.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

4.1.13 Surface water collected from curbed operating areas, including spent fire water runoff, shall be classified as potentially contaminated and subject to treatment.

4.1.14 Existing offsite runoff blocked by development shall be rerouted to return flow to original configuration or to approved discharge points.

4.1.15 Reinforced concrete headwalls and/or rip-rap aprons shall be provided at inlets and outlets of culverts.

4.1.16 Riprap aprons shall be designed in accordance with HEC-14 or local practice. Riprap shall be underlain with granular filter layer or filtration geotextile fabric.

4.2 Design Methods

4.2.1 The Rational Method shall be used for determination of stormwater peak flows for individual drainage areas up to 200 acres in size. Project areas greater than 200 acres shall be divided into smaller drainage areas, each being less than 200 acres in size, for analysis.

The Rational Method equation:

$$Q = \frac{CIA}{Z}$$

Q = Peak rate of runoff in (cfs)
C = Runoff coefficient representing the ratio of runoff to rainfall
I = Average intensity of rainfall (in/hr) from the IDF curves corresponding to the time of concentration, tc, and average recurrence interval
A = Drainage area (ac)
Z = Conversion factor, 1

4.2.2 Design rainfall intensity and depth shall be based on tables below:

Table 5: Rainfall Intensity (in/hr)

Rainfall Duration	10 YR ARI	25 YR ARI	100 YR ARI	500 YR ARI
5 min	10.50	12.60	15.70	19.70
10 min	8.32	10.00	12.50	15.40

Source: NOAA Atlas 14 Point Precipitation Frequency Estimates: TX; Time series type - Annual Maximum
Location information: Port Arthur, Texas; Latitude: 29.7928, Longitude: -93.9551 (ref. BEDD)

4.2.3 Runoff coefficient C shall be based on the retention characteristics of the surface under consideration. Values provided in Table 7, Runoff Coefficient, shall be used and shall be weighted according to area in the case of multiple classifications.

Table 7: Runoff Coefficient

Surface Preparation	Runoff Coefficient, C
Pavement	
Hot Mix Asphalt	1.00
Concrete	1.00
Compacted gravel area	0.70
Unimproved area	0.40

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

4.2.4 Consideration should be given to frequency between storms and existing ground conditions prior to event. Multiply coefficients by the frequency factors provided in Table 8, Frequency Factor. The resulting runoff coefficient shall not exceed 1.00.

Table 8: Frequency Factor

Annual Recurrence Interval (years)	Frequency Factor
10	1.00
25	1.10
50	1.20
100	1.25

Source: HEC 22, Third Edition, Urban Drainage Design Manual, 2009

4.2.5 Time of Concentration, T_c, shall be determined by summing the travel time of the various consecutive flow segments (overland flow, shallow concentrated flow, channel flow, etc.). The minimum T_c shall not be less than 6 min. (0.1 hr).

4.2.6 Determine overland/sheet flow time using the TR-55 modified kinematic wave equation for distances less than 300 ft:

$$T_O = \frac{0.42(nL)^{0.8}}{(P_2)^{0.5} S^{0.4}}$$

T_O = Overland Travel Time, min.
n = Manning's roughness coefficient
L = Flow Length, ft.
P_2 = 2-year, 24 hour rainfall, in.
S = land slope, ft/ft

4.2.7 Overland flow for distances greater than 300 ft. will begin to form small channels and should be considered shallow flow. Determine shallow concentrated flow velocity using the following formula (HEC 22):

$$V = K_u k S^{0.5}$$

V = shallow concentrated flow velocity, ft/s
K_u = 3.28
k = intercept coefficient (see Table 9, Intercept Coefficient)
S = slope, %

Table 9: Intercept Coefficient

Land Cover/ Flow Regime	Intercept Coefficient, k
Forest w/ heavy ground litter; hay meadow	0.076
Trash fallow or minimum tillage cultivation; contour or strip cropped; woodland (overland flow)	0.152
Short grass pasture (overland flow)	0.213
Cultivated straight row (overland flow)	0.274
Nearly bare and untilled (overland flow); alluvial fans in western mountain regions	0.305
Grassed waterway (shallow concentrated flow)	0.457
Unpaved (shallow concentrated flow)	0.491
Paved area (shallow concentrated flow); small upland gullies	0.619

Source: HEC 22, Third Edition, Urban Drainage Design Manual, 2009

4.2.8 Channel flow times shall be determined in accordance with Section 4.3.

4.3 Open Channels

4.3.1 Design open channels, and culverts using the Manning's equation:

$$V = \frac{k}{n} R^{2/3} S^{1/2}$$

$$Q = AV$$

V = Average velocity, ft/s
Q = Discharge flow, ft^3/s
k = Conversion factor, 1.49
n = Manning's roughness coefficient
A = Flow cross sectional area, ft^2
R = Hydraulic radius, ft.
S = Slope, ft./ft.

4.3.2 Manning's roughness coefficient (n) shall be as shown in Table 10, Manning's Roughness Coefficient.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.

Table 10: Manning's Roughness Coefficient

Channel Material	Manning's "n"
Asphalt	0.014
Rock, D50 ≤ 3 in.	0.030
Earth	0.025
Grass (Short)	0.030
Rip-rap	0.040
Grouted Rip-Rap	0.030
Gabions	0.030
Mattresses	0.025
Concrete	0.013
Gunite	0.016
Gravel Surface	0.025
HDPE Pipe	0.013
PVC Pipe	0.011

4.3.3 Channels shall typically be trapezoidal in cross section with a minimum 2 ft. bottom width. Maximum side slope shall be 2 horizontal to 1 vertical unless lined with concrete.

4.3.4 Freeboard should be provided to the top of bank for all channels. Minimum freeboard height to be 6 in. above the 10-year annual recurrence interval storm design water surface elevation.

4.3.5 Minimum pipe size for culverts shall be 18 in. Structural design of culverts shall be in accordance with the AASHTO LRFD Bridge Design Specification.

4.3.6 Where flexible linings are used, linings that are resistant to erosive forces of expected velocities during peak design flows shall be provided.

4.3.7 Shallow swales may be used to convey surface runoff where flow depth from the design rain event will be less than 8 in.

4.3.8 Provide concrete trenches where required due to space limitations or traffic requirements present a safety concern for the use of open ditches.

4.3.9 Concrete trenches required in paved process (spill containment) areas shall be designed as water-tight concrete structures in accordance with ACI 350.

© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

4.3.10 Where concrete trenches are used, provide grating as required by NAAMM MBG534.

4.3.11 Identify size and type of grating on design drawings in accordance with NAAMM MBG531, or NAAMM MBG532.

4.4 Underground Storm Drain System

4.4.1 Material selection shall consider specific site conditions and soil characteristics. Storm sewers and culverts shall be:

a) Reinforced Concrete Pipe per ASTM C76, Class IV

b) Reinforced Concrete Box sections per ASTM C1433 or ASTM C1577

c) Polyvinyl Chloride Pipe per ASTM D1785 and ASTM D2855

d) Corrugated Plastic Pipe per ASTM F2306

e) Corrugated Steel Pipe per ASTM A760 and ASTM B633

f) Perforated Polyvinyl Chloride pipe shall be in accordance with ASTM D2729.

g) Perforated High Density Polyethylene pipe shall be in accordance with ASTM F2648.

4.4.2 Storm drain design tailwater condition shall be the average of critical depth and the height of the storm drain conduit, (dc+D)/2, design tailwater, or mean high tide whichever is greater.

4.4.3 Storm sewer culvert headwater shall not exceed the top of road for the 25-year annual recurrence interval storm.

4.4.4 Storm drains should be designed for open channel flow unless the outfall is submerged.

4.4.5 A minimum full flow velocity of 3 ft/s shall be provided at peak flow conditions.

4.4.6 Maximum velocity for gravity storm drain systems shall not exceed 8 ft/s without energy dissipation at the outfall and in no case should exceed 15 ft/s.

4.4.7 Minimum pipes sizes for the storm drain system shall be:

a) Lateral and sub-lateral: 8 in.

b) Trunk lines: 12 in.

4.4.8 The pipe size shall not decrease in the downstream direction of flow.

4.4.9 Cover over pipe and culvert installations shall be designed to support HS20-44 live loads.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

4.4.10 A minimum cover for all culvert pipes shall be 18 in., unless justified by calculation.

4.4.11 For pipe under rigid pavement minimum cover may be reduced to 12 in. from the top of pipe to the finished grade and to 6 in. from the top of the pipe to the bottom of concrete pavement if reinforced concrete pipe (ASTM C76, Class V) is used.

4.4.12 Pipe drainage system including culverts shall not be utilized in potential LNG, LPG, Refrigeration storage and process spill areas.

4.5 Spill Conveyance Systems

4.5.1 A spill conveyance system for flammable and cryogenic liquids in accordance with the requirements of NFPA 30, NFPA 59A, and project requirements shall be provided.

4.5.2 Enclosed drainage channels shall not be used for cryogenic liquids.

4.5.3 Spill containment trenches in combination with area paving shall provide minimum grade and separation distances per NFPA 30 and NFPA 59A.

4.5.4 Cryogenic liquid spill containment trenches shall be concrete per ACI 350, unless otherwise noted.

4.5.5 Trenches shall be sized to convey the design spill rate or potentially contaminated rainwater whichever is greater. Minimum trench width shall be 2 ft.

4.5.6 Surface drainage in areas containing equipment which processes LNG and/or LPG shall be accomplished by "sheet drainage" of the area to a trench or series of trenches.

4.5.7 LNG containment pits/ impoundment basins shall be designed in accordance with 26196-100-3BD-U04-00001, Spill Containment Design Basis.

5.0 SUBSURFACE DRAINAGE SYSTEMS

5.1 General

5.1.1 Subsurface drainage systems for the removal of detrimental amounts of free groundwater shall be provided as required.

5.1.2 Sub-drainage systems shall be perforated PVC or polyethylene pipe placed at the bottom of a narrow trench and backfilled with filter gravel.

5.1.3 The system may consist of single subdrain pipe or multiple pipes placed in a grid pattern depending on area to be drained, and quantity of water to be collected.

5.2 Design Criteria

5.2.1 Minimum pipe size shall be 6 in.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

5.2.2 Perforations shall be in the bottom half of pipe below horizontal axis. Where sections of drain serve only to conduct water, perforations shall either be omitted or rotated to top and covered with PVC film.

5.2.3 Bottom of subdrain pipe shall be placed deep enough to accomplish desired draw down of free water within seepage zone.

5.2.4 Drainage trench width should be min 8 in. wider than pipe diameter. Normally, filter media shall be placed from bottom of pipe to the depth of water bearing strata.

5.2.5 Pipe and filter media shall be wrapped with separation/filtration geotextile fabric to control infiltration of fines and still allow sufficient passage of water.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.

1.0 GENERAL

Port Arthur LNG, LLC (PALNG) is developing a Liquefied Natural Gas (LNG) production and export facility on a site located on the western shoreline of the Port Arthur Canal in Jefferson County, Texas. The project base scope will include two (2) identical LNG trains, two (2) LNG Storage Tanks, one (1) LNG Carrier Berth, and associated utilities/facilities. Overall site plan is shown in **Figure 1**.

As part of the PALNG project development, an earthen levee will be constructed around the perimeter of the plant as shown in **Figure 2** in order to protect the LNG plant against a 500-year return period storm surge event with associated wave conditions (Ref. 1).

The purpose of this report is to summarize geotechnical conditions, analyses, and recommendations for the design and construction of the perimeter levee. All elevation reported in the document is with respect to NAVD88.

2.0 GEOTECHNICAL INVESTIGATION DATA

The Owner conducted geotechnical investigations in several phases from 2004 through 2015; PSI conducted geotechnical investigations in 2004, and Fugro performed the additional investigations in 2006 and 2015. Due to insufficient data for Bechtel to develop an EPC Lump Sum Turn Key (LSTK) price, an EPC level geotechnical investigation was conducted by the Owner in 2019. The investigation scope was developed by Bechtel G&HES group and the final scope of work was agreed by the Owner. Bechtel received the following geotechnical investigation reports;

- Fugro EPC Level Geotechnical Data Report Port Arthur LNG Project (Report No. 04.10180165-1 Rev.2 dated December 6, 2019)
- Fugro Geotechnical Study Port Arthur LNG Project (Report No. 04.10150037 dated October 20, 2017)
- Thompson Report of Geotechnical Consulting Services – Phase 1 Pre-Feed Soil Stabilization Trials Port Arthur, Texas (Report No. 16-1101-0157 Rev.1 dated October 11, 2016)
- Fugro Geotechnical Investigation Port Arthur LNG Receiving Terminal – LNG Tanks (Report No. 0415-1422-1 dated May 31, 2006)
- Fugro Geotechnical Investigation Port Arthur LNG Receiving Terminal – SH 87 (Report No. 0415-1422-2 dated June 2, 2006)
- Fugro Geotechnical Investigation Port Arthur LNG Receiving Terminal – Process Area, Marine Area, and Levee (Report No. 0415-1422-3 dated July 30, 2006)
- PSI Geotechnical Exploration Report Proposed Sempra Energy LNG Import Terminal Port Arthur, Texas – Harbor/Marine Berthing Area, Process Area, Plant Roadways, Highways, Embankment, and Dikes (Report No. 286-45123-General dated October 29, 2004)
- PSI Geotechnical Exploration Report Proposed Sempra Energy LNG Import Terminal Port Arthur, Texas – LNG Tank Area (Report No. 286-45123-Ttank dated September 20, 2004)
- PSI Geotechnical Exploration Report Proposed Sempra Energy LNG Import Terminal Port Arthur, Texas – Phase II LNG Tanks (Report No. 286-45123-Tank-Addendum B dated October 29, 2004)

Geotechnical investigation locations from the investigations along the perimeter levee are shown in **Figure 3**. Our recommendations in this report will be based on the geotechnical data provided in the above reports.

3.0 SITE CONDITIONS

3.1 Site Surface Conditions

The project site is located on low-lying lands on the west bank of the Sabine-Neches Waterway with much of the area covered by wetlands. Forested wetlands with numerous tall trees, shrubs, and ponded water in several areas are scattered throughout the project site. The project site is undeveloped and mostly covered with vegetation consisting of heavy brush and trees. The Fugro's EPC Level Geotechnical Data Report (Ref. 1) indicates that the area had been previously used for disposal of dredged material removed during maintenance dredging operations in the Port Arthur Ship Channel. However, there has been no indication of dredge disposal activities at the project site in recent years. Due to the presence of standing water and soft soil conditions, site accessibility was very difficult for the previous geotechnical investigation by Fugro. A review of available topographic data indicates that existing site grade elevation varies from approximately EL +0.0 ft to EL +12.0 ft as presented in **Figure 4**. Site conditions encountered in pertinent areas are summarized in **Table 1**.

Table 1: Site Surface Conditions

Area	Existing Elevation (ft)	Site Conditions
Eastern and Southern Levee Alignment / Train / Utility	EL +1.0 to EL +12.0	Site grade varies significantly in this area, with the site grade decreasing from east to west. Thick vegetation consisting of clusters of small trees and shrubs were encountered in this area. Standing water was encountered to the eastern portion of this area.
Western Levee Alignment / Building	EL +2.0 to EL +4.0	This area is relatively level with shrub type vegetation. The average elevation in this area is about EL +2.5 ft.
Berth	EL +2.0 to EL +10.0	This area is covered with thick vegetation consisting of small trees and shrubs. Standing water was encountered in portions of this area. The average elevation in this area is about EL +7.0 ft.
LNG Tank	EL +2.0 to EL +9.0[1]	The site grade in this area generally decreased from east to west. Standing water was encountered in parts of this area. Vegetation varied from small shrubs to thick trees from west to east in this area.

NOTE: Existing grade elevations of perimeter levee alignment are considered as EL +1.0 ~ EL +7.0 ft.

During the EPC level geotechnical investigation conducted in early 2019, access to drilling and other field test locations was very difficult due to soft, marshy ground. The site conditions observed during the investigation are described in Section 3.2 of this report to provide guidelines on site access during construction.

3.2 Field Observations during Supplemental Geotechnical Investigations in 2019

Observations provided in this section are from the EPC level geotechnical investigation conducted in early 2019. These observations and implemented procedures for drill site access provide indication of the expected conditions during initial site access for construction.

The project site is mostly low and relatively flat with change in elevation ranged from approximately EL. +0 ft to EL. +12 ft. The higher areas are mostly man-made, such as dikes and old dredge fill areas, and support thick brush and modest tree growth. The lower areas are very wet, mostly under shallow water, and support marsh grasses, aquatic vegetation and stunted shrubs. This wetland area has been a challenge in which to perform the supplement geotechnical investigations and will certainly present challenges to early site works such as initial earthwork and construction of access roads, staging areas and laydown areas. **Figure 5** and **Figure 6** show the single, existing staging area used for the supplemental geotechnical investigations.

Vegetation clearing for both surveying and access roads was not particularly difficult because the subcontractors were experienced and used the correct equipment. **Figure 7** through **Figure 13** show the airboat, Marsh Master tracked vehicles, all-terrain vehicles (ATVs), and GyroTrac used at the site. The Marsh Masters were equipped with Brush Hog-style, rotary-bladed mowers and were sufficient in cutting most marsh vegetation including thick brush and thin saplings. Thicker trees were cut with a GyroTrac, which was sufficient for small trees. However, the GyroTrac was not particularly good in the soft ground despite the steel tracks. It worked well on the higher, drier ground but easily became mired in the mud. In the mud, their experience showed that heavy machinery on smaller tracks, like the GyroTrac, did not perform properly as well as the lighter, much wider tracked Marsh Master buggies and larger swamp buggies.

The drilling rigs and cone penetrometer test (CPT) rigs were mounted on a variety of tracked vehicles together known as swamp buggies or marsh buggies, presented in **Figure 14** through **Figure 18**. The Marsh Master buggies are smaller tracked vehicles than the swamp buggies.

The access roads were cleared of vegetation but otherwise unimproved. Vehicle traffic, regardless of the type and size of the vehicles, rapidly churned the roads to deep, sticky mud resembling rivers of slow-moving sludge, shown in **Figure 19** through **Figure 23**. The only vehicle other than the swamp or Marsh Master buggies that can navigate the access roads are the single-seat, motorcycle-style ATVs, shown in **Figure 24**. Four-wheel drive pickups, heavy trucks and the larger ATVs will not work, and foot traffic is nearly impossible.

3.3 Generalized Subsurface Conditions

All available borings and CPTs data are reviewed to develop generalized subsurface profiles for different areas of the project. Generalized descriptions of the subsurface conditions are discussed below. Soil profiles identifying the various strata at different areas are presented on Plates 4a through 4r of the Fugro's EPC Level Geotechnical Data Report (Ref. 1). The following strata have been identified in all areas; soil layering and properties specific to perimeter levee are further discussed in Section 0.

Stratum 1: Cohesive soils consisting of clay, and sandy/silty clay generally extends from the surface to a depth of about 150 to 175 feet below existing grade. In general, the upper approximately 15 feet of this stratum is very soft with undrained shear strengths as low as 0.1 ksf, (very soft), and the underlying soils appear to be firm (undrained shear strength (Su) of 0.5 ksf) to very stiff (up to Su of 3.5 ksf). Relatively thicker very soft clay layer was encountered in the MOF, Berth and Building areas. A 2-feet to 10-feet thick organic layer was encountered at bottom of the Stratum 1. The moisture contents and plasticity index values measured within this organic layer were much higher than the values obtained for Stratum 1.

Stratum 2: Natural granular soils consisting of sand, silty sand, and sandy silt extend below the cohesive soils (i.e. Stratum 1) to a depth of about 185 feet below existing grade. The sandy soils encountered in this stratum is considered medium dense to very dense based on recorded SPT N-values.

Stratum 3: Natural cohesive soils extend below the granular layer (i.e. Stratum 2) to a depth of about 270 feet below existing surface based on select borings in the Berth, LNG Tank, and Building areas. The soil layer similar to Stratum 3 is anticipated in other areas, but it was not confirmed due to limited soil boring information. Based on the field and laboratory measurements, undrained shear strengths in these soils generally range from 1.0 ksf (stiff) up to 4.0 ksf (hard).

Stratum 4: Natural granular soils consisting of sand and silty sand extend below the cohesive soils (i.e. Stratum 3) to a depth of about 300 feet below existing grade. The sandy soils encountered in this stratum is considered very dense with recorded N-values greater than 50 blows per foot. This stratum was encountered only at deep borings (greater than 275 feet) conducted in the Berth, LNG Tank, and Building areas.

3.4 Groundwater

Onshore soil borings were initially drilled using the dry-auger technique to estimate the depth-to-water. Once free-water was encountered, drilling was halted, and depth-to-water observations were made in the open boreholes. After a period of about 10 to 20 minutes, depth-to-water measurements were observed again. During the supplemental geotechnical investigations in 2019, 24-hr depth-to-water observations were performed at selected boring locations (i.e. B-123, B-127, B-134, and B-136). Based on the location and the ground surface elevations of the project site, it is estimated that water to be present at very shallow depths. Standing water was present in most of the areas within the project site at the time of geotechnical investigations. In addition, it is anticipated that perched water within the dredged material encountered at the site. Water levels will fluctuate with seasonal variations in rainfall and surface runoff, especially during extended periods of heavy rainfall. It may also be impacted by tidal fluctuation in the ship channel. It is possible that the groundwater level could rise to the ground surface during extended periods of heavy rainfall. Due to poor drainage at the site, water frequently ponds for an extended period of time after a rain event. Therefore, it is recommended that the groundwater level is considered at the existing grade for design and construction planning purposes.

4.0 LEVEE CONFIGURATION AND CONSTRUCTION INPUTS

4.1 General Levee Configuration

State Highway 87, pipelines and utility infrastructure will be relocated as mentioned in Section 1.0. An earthen levee is planned along the perimeter of the plant, as shown on **Figure 25**, to protect the plant facilities from storm surge and flooding.

In order to study the variation of subsurface condition and the geometry of the levee along the alignment, a number of cross sections are prepared and subsurface conditions at the cross sections are evaluated. The locations of the cross sections are shown in **Figure 25**. Based on the review of subsurface conditions and the geometry of the levee, the levee alignment is divided into three (3) segments; Segment-1 (North – Building/South Berth Area), Segment-2 (West, South and Northeast – Utility/Laydown/Other Area), and Segment-3 (Southeast – Ground Flare/Stormwater Pond Area). These segments with cross sections A-A’

through H-H' are shown in **Figure 25** and levee configuration with each cross section is presented in **Figure 26** through **Figure 30**. In addition, cross sections D-D', E-E' and F-F' provide approximate locations of the levee and existing State Highway 87 presented in **Figure 27** through **Figure 29**.

It is understood that the western levee of Segment 1 and Segment 2 has limited availability of the real estate and the toe of the levee coincides with the property line, thus the levee construction or any subgrade preparation prior to levee construction at the western boundary cannot extend beyond the property line. In addition, the existing State Highway 87 will be abandoned after completion of highway relocation which will be approximately 200 ft away from west and south of levee alignment. Texas Department of Transportation (TXDOT) proposed the State Highway 87 improvement plan per TXDOT contract drawings (Ref. 13), however Bechtel is not aware of the construction schedule for TXDOT's slope protection. Therefore, this improvement plan was not considered in the slope stability analyses for cross sections D-D', E-E' and F-F'. Section 7.2 provides more details of levee slope stability analysis

The top elevation of the levee will be at Elevation +20.6 feet and the top of the levee will be about 15 feet wide with a 3H:1V slope at both sides. The levee will be constructed at the existing grade generally ranging from Elevation +1 to +7 feet, with the final rough grade of the plant site around Elevation +7 feet.

4.2 Site Preparation prior to Levee Construction

The project site is a marsh area within a few miles of the Gulf of Mexico and mostly covered with vegetation consisting of heavy brushes and trees, thus the site shall be cleared and grubbed. Stripping should be to the minimum depth necessary to remove all vegetation and roots (entire root-ball systems). It is estimated that an average stripping depth of 2.5 feet across the entire site for the perimeter levee should be adequate at this stage. However, greater stripping depths may be required in localized areas due to existing root systems of trees, brushes, etc. and natural variation in subsurface conditions. The exact depth of stripping should be determined in the filed in consultation with the field geotechnical engineer. After clearing/grubbing/stripping, subgrade stabilization along the entire alignment shall be carried out prior to constructing the levee.

The exposed clayey subgrade after stripping shall be improved by in-place mixing with lime and/or cement to provide stable platform for levee construction. It is recommended that 10 feet shallow soil stabilization with a target unconfined compressive strength of 35 psi for Segment-1 and Segment-3, and 7 feet for Segment-2. Soil stabilization shall extend minimum 15 feet horizontal distance from toe of the levee at both sides. The subgrade improvement requirements have been determined based on the slope stability analyses described later in the report.

Laboratory bench scale testing program has been completed to select lime and cement quantities for subgrade improvement. Based on the laboratory bench scale testing results, it is recommended that subgrade soils be improved with 4% quicklime (pelletized) and 7% cement by wet soil weight of 100 lbs/ft^3 with the W/C ratio of 0.75. This includes some allowance for potential field variation of cement dosage established in the laboratory. These will be further refined after completing stabilization field trials.

Water in the low lying areas need to be drained prior to performing the soil stabilization to maintain "dry" conditions during site preparation.

Due to expected high settlement, wick drains should be installed under the levee to accelerate settlement and strength gain in the underlying soft clay layer. Wick drains will accelerate pore pressure dissipation and hence the underlying soil will gain strength while reducing the time required for primary consolidation

settlement. Wick drains will be installed after stabilized soils gain sufficient strength to support construction equipment.

The following construction sequence should be implemented after stripping operation along the levee alignment. Details of site preparation recommendations are illustrated in a story board format as shown in **Figure 31** through **Figure 34**, except as described in Section 4.3 for a portion of Segment 1 and Segment 2:

1) Stabilize the subgrade soils to a depth of 10 feet for Segment-1 and Segment-3, and to a depth of 7 feet for Segment-2 with a target unconfined compressive strength of 35 psi by mixing with cement and/or lime. Soil stabilization shall extend minimum 15 feet horizontal distance from toe of the levee at both sides.
2) Upon completion of the soil stabilization, low permeability fill shall be placed to provide a proper sloping surface to ensure the horizontal wick drains will maintain positive drainage flow from center to outside of the levee during consolidation of the levee, as illustrated in **Figure 31** through **Figure 34**.
3) Install vertical wick drains to a depth of 50 feet with a center-to-center spacing of 5 feet in a triangular pattern, and then install the horizontal wick drains. The wick drains should extend minimum 10 feet horizontal distance from toe of the levee at both sides.
4) Install 3 feet wide and 6 feet deep cut off wall with minimum 2 feet keyed into the soil stabilized layer, as illustrated in **Figure 31** through **Figure 34**.
5) Place and compact low permeability fill per the requirement in the Project Specification for Site Preparation and Earthworks [26196-100-3PS-CG00-00001 (PAL-PJT-CIV-STD-00-X-0001)]. Low permeability fill should be tested to confirm the conformance with the specification requirement by performing permeability, UC (Unconfined Compression) and direct shear tests in addition to “standard” compaction tests.
6) Re-work/replace any fill not meeting specified requirements as necessary and re-test until acceptable testing results are achieved.
7) Construct levee surface/slope protection.

During the construction phase, a field geotechnical engineer shall oversee the construction of perimeter levee including site preparation, soil stabilization, fill placement and compaction, and instrumentation monitoring. The field geotechnical engineer will review the in-situ and laboratory test results of the fill and stabilized soils and inspect the subgrade conditions before the fill placement. The field geotechnical engineer shall be notified with any anomaly occurring during the levee construction. It also should be noted that some steps recommended above could be carried out simultaneously in different levee segments.

4.3 Special Constructability Considerations

The real estate available at the western levee of Segment 1 and Segment 2 adjacent to the property line is very limited. The levee toe coincides with the property line, in which case horizontal extension of the subgrade stabilization to 15 feet beyond the western toe of the levee is not available which is required for levee stability. In addition, the horizontal wick drains that facilitate the horizontal water flow from vertical wick drains cannot be routed to outside of the property line.

With both considerations, it is recommended that sheet pile wall (AZ-14) be constructed at the toe of the levee that functions as a buttress to improve levee stability. The tip elevation should be at least Elevation -33.5 ft so that it provides stability to levee. Horizontal wick drain under the levee should be installed such that water flow occurs from outside edge of the levee to a trench located near inside toe of the levee.

5.0 DESIGN DATA

Following are the basic design data for the Perimeter Levee.

5.1 Flood Level

Based on the Overtopping and Levee Elevation Assessment Report (Ref. 21), the maximum water level elevation of +14.6 feet (NAVD88) outside the plant corresponding to 500-year Storm Still Water Elevation (SWEL) and Relative Sea Level Rise (RSLR) has been suggested for the geotechnical design of perimeter levee in this report.

However, we started analyses with the maximum water level of Elevation +16.6 feet (NAVD88) based on the previous Marine Site Characteristics Report (Ref. 20) prepared during a EDSA (FEED) phase. After completion of our analyses, it was recognized that the maximum still water level has been updated to Elevation +14.6 feet. We did not re-run the stability analyses since the analyses based on the maximum still water elevation of +16.6 ft is considered conservative.

5.2 Seismic Design Criteria

As noted in Fugro's Site-Specific Seismic Hazard Assessment Report (Ref. 4), the site is located in a zone of relatively low seismicity, with peak ground acceleration (PGA) shown in **Table 2** below:

Table 2: Horizontal Peak Ground Accelerations

Events	Horizontal PGA
475-year Return Period (OBE)	0.042g
2475-year Return Period (SSE)	0.116g

NOTE: OBE = Operating Basis Earthquake, SSE = Safe Shutdown Earthquake

5.3 Loading

A standard surcharge of 250 psf on top of the perimeter levee has been considered. This typically covers standard construction equipment of up to 15-20 ton.

5.4 Materials and Test Requirements

The requirements for materials, types of tests and testing frequency for levee construction are provided in the Sections 2.10, 3.7, 3.15 and 4.2 of the Project Specification for Site Preparation and Earthworks [26196-100-3PS-CG00-00001 (PAL-PJT-CIV-STD-00-X-0001)].

In addition, the Project Specification for Soil Improvement [26196-100-3PS-CY05-00002 (PAL-PJT-CSA-STD-00-GEN-0002)] requires post-acceptance testing to be performed on the stabilized soils to meet the acceptance criteria to confirm uniform mix with unconfined compressive strength of 35 psi.

5.5 Instrumentation

It is recommended that the following instrumentations for monitoring levee performance should be installed in accordance with the Project Specification for Installation and Monitoring Geotechnical Instrumentation [26196-100-3PS-CY05-00004 (PAL-PJT-CSA-STD-00-GEN-0004)]:

- Fifteen (15) settlement monitoring plates
- Twenty (20) inclinometers
- Fifteen (15) vibrating wire piezometers

Settlement monitoring plates shall be installed at the existing grade along the perimeter levee after stripping and shallow soil stabilization prior to placement of low permeability fill. At five (5) selected locations, inclinometers shall be installed at the toe and 20 feet away from the toe on both sides of the levee. Vibrating wire piezometers (VWPs) shall be installed in a boring drilled at the levee centerline at five (5) selected locations. VWPs shall be installed at 20 feet depth increment to a depth of 60 feet in each boring (i.e. 3 VWPs per boring). These instruments will help monitor levee stability during construction and the long-term performance thereafter. Monitoring shall be conducted on a daily basis during low permeability fill placement, and on a weekly basis for 3 months upon completion of fill placement, and on a bi-weekly basis thereafter until directed by the field geotechnical engineer for termination of monitoring.

Extra caution shall be exercised to avoid any damage to the monitoring instrumentation during construction until termination of the monitoring program. A layout of the recommended site wide instrumentation plan is shown in **Figure 37**.

5.6 Slope Surface Erosion Protection

It is assumed that proper erosion control measures and maintenance program will be implemented to protect the surfaces of perimeter levee at both sides during repeated flood, runoff, and storm surge events. The design of surface protection and maintenance program are out of scope of this report and the contribution to slope stability from surface protection has not been considered in our slope stability analysis.

6.0 DESIGN CRITERIA

The design requirements with respect to global stability, settlement, seepage and blowout are discussed in the following sections.

Based on existing soil conditions and recommended soil stabilization, it is expected that no bearing failure under the weight of the perimeter levee with design levee configuration. With low permeability fill specified to construct the levee, the internal erosion and piping potential through the levee itself should not be a design concern.

6.1 Global Stability

The following design conditions were analyzed to confirm Factor of safety (FOS) requirements would be achieved:

1) Short-term condition (during construction and operation) - minimum required FOS of 1.3
2) Long-term condition - minimum required FOS of 1.5
3) Rapid drawdown condition - minimum required FOS of 1.1

4) Maximum still water condition - minimum required FOS of 1.1
5) Seismic conditions - minimum required FOS of 1.1 or demonstrate lateral deformation of the slope is acceptable.

6.2 Settlement

The top of levee elevation must always not be lower than the worst-case design elevation for hydrologic conditions. Levee top elevation must be set higher during construction to compensate for the estimated long-term settlement and/or the top of levee elevation shall be regularly checked and maintained during the plant operation.

6.3 Seepage and Blowout Potential

Based on the soil information obtained from the soil borings/CPTs performed close to the proposed perimeter levee alignment, sandy soils consisting of silty sand were encountered in 8 locations (i.e. B-108, B-CPT-125, CPT-122, CPT-179, CPT-181, CPT-182, CPT-183, SCPT-105) within about EL. -30 feet. The existing sandy soils are generally more permeable than the clay soils but are not as permeable as clean sands or gravels. Given the depth of these isolated and interspersed sandy soils and relatively short duration of the design flood, seepage and blowout under the perimeter levee are not anticipated. If shallow sand channels are found during construction, the sand channels should be removed from the perimeter levee footprint and backfilled with clay select fill or low permeability fill.

7.0 ANALYSIS METHODOLOGY

7.1 General

The general methodology for performing slope stability analyses of the levee was as follows:

1. Evaluate subsurface data, soil borings and cone penetration tests (CPTs), along the levee alignment and establish representative subsurface sections and the areal limits of these sections.
2. Generate subsurface sections using borings and CPTs for each of the three levee segments. The extent of each levee segment is shown on **Figure 25**.
3. Develop representative soil stratigraphy for each levee segment. Evaluate engineering properties including shear strength (undrained S_u, and drained c' and ϕ' values) and soil compressibility for each levee segment as shown on **Figure 38** through **Figure 43**. Soil compressibility is interpreted based on field and laboratory test results for the entire site area with engineering judgment.
4. Assign soil properties for each soil layer as determined from Step 3.
5. Generate levee profiles for analysis, by combining design levee cross section profiles (i.e. A-A' through H-H' shown on **Figure 26** through **Figure 30**) and the corresponding subsurface profiles defined in Step 3.The appropriate engineering properties assigned in Step 4 are also added.
6. Select critical cross section profiles of A-A', C-C' for Segment-1, G-G' for Segment-2, and F-F' for Segment-3, respectively.
7. Perform analyses for slope stability and settlement. Additional details of the methodology for each type of analysis are provided in Sections 7.2 and 7.3, respectively.

7.2 Slope Stability

Slope stability analyses were conducted using computer program Slope/W (2018 R2 Version 9.1.1.16749), by GEO-SLOPE International (Ref. 12), using Spencer method for the conditions listed in Section 6.1. Analyses were conducted using both circular slip and block failure mechanisms. In some cases, block failure mechanism yielded substantially lower FOS. These cases were carefully examined for its validity by conducting additional analyses with Bishop and Janbu methods. In all cases, except seismic loading condition, a surcharge of 250 psf, to account for construction traffic, was applied at the levee crest.

The critical section for each levee segment was selected based on the loading, levee geometry, and subsurface soil conditions. Slope protection details as part of the State Highway 87 improvement plan proposed in the TXDOT contract drawings (Ref. 13) were not incorporated since Bechtel is not aware of the construction schedule for TXDOT's slope protection. Therefore, cross section profile of F-F' for Segment-3 was conservatively based on the existing slope toward the ship channel provided by bathymetry survey data available from Fugro's EPC Level Geotechnical Data Report (Ref. 1). The results are presented in Section 9.1.

7.3 Levee Settlement

Levee settlements for all segments were estimated using computer program UniSettle by UniSoft Geotechnical Solutions Ltd. (Ref. 14. UniSettle program uses conventional compressibility parameters for soils such as elastic modulus (E), compression index (C_c), recompression index (C_r), initial void ratio (e_0), pre-consolidation margin ($\Delta p'$), and secondary compression index (c_α) to calculate the settlement under the applied load. Westergaard's stress distribution method (Ref. 15) was used in UniSettle calculations. The results are presented in Section 9.2. The settlement values shall be used to estimate the quantity of fill required for compensating settlement.

8.0 SOIL DESIGN PARAMETERS

8.1 Strength Parameters for Slope Stability

The perimeter levee was subdivided into three segments as indicated in **Figure 25** based on the subsurface soil conditions. These segments with soil strength parameters are summarized in **Table 3**. The subsurface cross section profiles to approximately Elevation -80 feet for each segment are considered in each slope stability analysis since the underlying stiff clay provided sufficient resistance against deeper slip surfaces.

Design undrained shear strength of native soils was estimated using field test data from all available CPT and SPT explorations (torvane tests) and laboratory test results (UU triaxial and mini vane tests). Selection of these undrained shear strength parameters is presented on **Figure 38** through **Figure 40**. Strength gain of the soft clays underneath the levee, based on the planned wick drain soil improvement program under levee alignment, was developed using the Stress History and Normalized Soil Engineering Parameters (SHANSEP) design procedure. Design undrained shear strength of the low permeability fill and improved soil was taken from the Project Specification for Site Preparation and Earthworks [26196-100-3PS-CG00-00001 (PAL-PJT-CIV-STD-00-X-0001)] and Project Specification for Soil Improvement [26196-100-3PS-CY05-00002 (PAL-PJT-CSA-STD-00-GEN-0002)].

Direct measurements of soil drained strength were not available for the site soils along the levee alignment. The soil drained parameters were estimated based on the consolidated-undrained triaxial compression test

results from other areas within the project site, empirical correlations and Bechtel's past experience on similar soils.

The interpreted soil undrained (S_u) and drained (friction angle ϕ' and cohesion c') strength parameters are summarized in **Table 3**.

Table 3: Summary of Soil Strength Parameters for Slope Stability Analyses

Levee Segment / Area	Elevation Top of Layer (ft)	Soil Type	Total Unit Weight (pcf)	Undrained		Drained	
				S_u (psf)	S_u (psf)[1]	c' (psf)	ϕ' (deg)
Segment-1 (North – Building/ South Berth Area)	20.6	Low Permeability Fill[2]	120	1500	N/A	300	26
	4.5	Improved Soil[2]	100	2500	N/A	500	26
	-5.5	Upper Soft Clay	100	250	400	50	21
	-18	Lower Soft Clay	100	450	500	90	22
	-30	Firm Clay	115	1100	N/A	200	25
	-40	Stiff Clay	115	1300	N/A	250	26
Segment-2 (West, South and Northeast – Utility/ Laydown/ Other Area)	20.6	Low Permeability Fill[2]	120	1500	N/A	300	26
	1.5	Improved Soil[2]	100	2500	N/A	500	26
	-5.5	Soft Clay	100	200	380	40	21
	-18	Firm Clay	115	900	N/A	180	24
	-35	Stiff Clay	115	1200	N/A	250	26
Segment-3 (Southeast – Ground Flare/ Stormwater Pond Area)	20.6	Low Permeability Fill[2]	120	1500	N/A	300	26
	4.5	Improved Soil[2]	100	2500	N/A	500	26
	-5.5	Upper Soft Clay	100	200	380	40	21
	-12	Lower Soft Clay	100	350	440	70	22
	-32	Stiff Clay	115	1200	N/A	250	26

NOTE: 1. SHANSEP equation based on the effective stress increase estimated S_u values after consolidation of clay under levee weight aided by the wick drain.
2. The soil parameters for low permeability fill were estimated based on the laboratory tests results on similar soils in Bechtel's past projects.

8.2 Compressibility Parameters for Settlement Estimates

The generalized compressibility parameters developed for the site were used to estimate the levee settlements. These parameters were obtained from all available consolidation test results as shown in **Figure 41** through **Figure 43**. The interpreted soil compressibility parameters (elastic modulus (E), compression index (C_c), recompression index (C_r), initial void ratio (e_0), pre-consolidation margin ($\Delta p'$), and secondary compression index (c_α)) are summarized in **Table 4**.

Table 4: Summary of Soil Compressibility Parameters for Settlement Estimate

Levee Segment / Area	Elevation Top of Layer (ft)	Soil Type	Total Unit Weight (pcf)	Compressibility Parameters					
				E (ksf)	C_c	C_r	e_0	$\Delta p'$ (ksf)[2]	C_α
Segment-1 (North – Building/ South Berth Area)	7[1]	Low Permeability Fill	120	500	-	-	0.5	-	-
	4.5	Improved Soil	100	2000	-	-	0.3	-	-
	-5.5	Soft Clay	100	-	0.65	0.125	1.5	0	0.015
	-30	Firm to Stiff Clay	115	-	0.22	0.04	1.0	5	-
	-145	Organic Clay	120	-	0.768	0.144	1.4	5	-
	-155	Dense Sand	125	1000	-	-	0.3	-	-
	-175	Stiff Clay	125	-	0.36	0.068	0.8	3	-
Segment-2 (West, South and Northeast – Utility/ Laydown/ Other Area)	4[1]	Low Permeability Fill	120	500	-	-	0.5	-	-
	1.5	Improved Soil	100	2000	-	-	0.3	-	-
	-5.5	Soft Clay	100	-	0.65	0.125	1.5	0	0.015
	-18	Firm to Stiff Clay	115	-	0.22	0.04	1.0	5	-
	-155	Organic Clay	115	-	0.768	0.144	1.4	5	-
	-165	Dense Sand	125	1000	-	-	0.3	-	-
	-180	Stiff Clay	125	-	0.36	0.068	0.8	3	-
Segment-3 (Southeast – Ground Flare/ Stormwater Pond Area)	7[1]	Low Permeability Fill	120	500	-	-	0.5	-	-
	4.5	Improved Soil	100	2000	-	-	0.3	-	-
	-5.5	Soft Clay	100	-	0.65	0.125	1.5	0	0.015
	-32	Stiff Clay	115	-	0.22	0.04	1.0	5	-
	-165	Dense Sand	125	1000	-	-	0.3	-	-
	-175	Stiff Clay	125	-	0.36	0.068	0.8	3	-

NOTE: 1. Existing grade at EL. +7 ft, +5 ft, +3 ft and +1 ft with 2.5 ft of stripping were considered for settlement analyses.

2. Pre-consolidation margin $\Delta p'$ = difference between preconsolidation pressure and overburden pressure

9.0 RESULTS OF SLOPE STABILITY AND SETTLEMENT ANALYSES

9.1 Slope Stability

Prior to the stability analysis, subsurface conditions along each segment of the levee were screened to select the most critical cross section location for subsequent analysis, capturing variations in levee geometry with final grade, local soil profiles, and loading conditions. Analyses were then performed on the selected cross sections for each levee segment. Maximum still water level from storm surge, surcharge loading, and seismic loading were considered in the analysis.

The applied loading, groundwater conditions, soil drained or undrained parameters for each case are summarized as follows:

1. Short-term condition – Undrained Strength Parameters

   Short-term condition with undrained strength parameters is checked for operational condition, as this case will be similar to conditions during construction.
   - Surcharge load of 250 psf on the top of the levee to account for construction or maintenance
   - Groundwater is at approximate existing ground level

2. Long-term condition – Drained Strength Parameters

   The slope stability with drained strength parameters is checked for the long-term conditions.
   - Surcharge load of 250 psf on the top of the levee to account for construction or maintenance
   - Groundwater level at approximate existing ground level

3. Rapid drawdown – Undrained Strength Parameters

   Drawdown of flood water against a slope consisting of low permeability soils can result in residual pore pressures remaining in the soil and potentially causing instability of the slope.
   For the perimeter levee constructed of low permeable soils, fully adjusting from a pre-surge condition to a steady-state condition under an increased hydraulic loading of a storm surge would take months or even years, while the storm surge itself will last a matter of hours or days. The study of consolidation test data also supported that there is not enough time for the pressures imposed by a storm or flood to develop into a steady-state flow regime. Therefore, stability evaluations for the perimeter levee under storm surge and eventual drawdown involves essentially no change in effective stress; rapid drawdown condition during storm surge becomes undrained analysis as discussed in Case 3 herein.
   - Maximum water level of Elevation +16.6 feet (NAVD88) within the levee cross section during rapid drawdown
   - Surcharge load of 250 psf on the top of the levee to account for construction or maintenance
   - Groundwater at approximate existing ground level outside the levee cross section

4. Maximum Still Water – Undrained Strength Parameters

Maximum still water level corresponding to 500-year storm against the outboard/exterior levee slope consisting of low permeability soils can result in residual pore pressures remaining in the soil and potentially causing instability of the slope.

However, it is also understood that the use of maximum still water level corresponding to flood elevation in this case is a very conservative assumption, as steady-state maximum still water level will not be achieved in relatively short time of storm surge or flood events. Even under the steady state, the water level within the levee at inboard side should be lower than the outboard. The response to these loads is undrained and involves essentially no change in effective stress.

- Maximum water level of Elevation +16.6 feet (NAVD88) against the outboard/exterior levee slope
- Water level within the levee is gradually decreased close to the ground elevation at the toe inside the levee
- Surcharge load of 250 psf on the top of the levee to account for construction or maintenance
- Groundwater at approximate finished grade level inside the plant area

5. Seismic condition – Undrained Strength Parameters

- Seismic horizontal coefficient of 0.077g corresponding to 2/3 of PGA under the maximum considered earthquake (MCE) condition is used in the pseudo-static analyses. In the pseudo static analyses, an acceleration multiplier is used to calculate the seismic coefficient, and it varies from 0.17 to 0.75 which are typically recommended in the literature. The acceleration multiplier of 2/3 (=0.67) had been used in the past Bechtel projects.
- Soil undrained shear strength parameters are reduced to 80% of the original values considering seismic effect. It's a recommended practice to reduce the undrained shear strength of non-liquefiable soils in the literature.

The analysis results for all the considered cases are summarized in **Table 5** and the Slope/W outputs are presented in **Figure 44** through **Figure 76**.

Table 5: Summary of Slope Stability Analysis Results

Levee Segment / Cross Section	Exterior Slopes - Resultant Factor of Safety (FOS)					Figure Nos.
	Short-Term (Undrained)	Long-Term (Drained)	Rapid Drawdown (Undrained)	Max Still Water (Undrained)	Seismic (Undrained)	
	Exterior I->O	Exterior I->O	Exterior I->O	Exterior I->O	Exterior I->O	
1 (A-A')	1.58 (B)	2.10 (S)	1.57 (B)	-	0.90 (B)	**Figure 44** thru **Figure 47**
1 (C-C')	1.88 (B)	2.03 (S)	1.87 (B)	-	1.16 (B)	**Figure 54** thru **Figure 57**
2 (G-G')	1.88 (B)	2.17 (S)	1.81 (B)	-	1.11 (B)	**Figure 58** thru **Figure 61**
3 (F-F')	1.31 (B)	1.55 (S)	1.29 (B)	-	0.79 (B)	**Figure 67** thru **Figure 70**
Req'd FOS	1.3	1.5	1.1	1.1	1.1	
Levee Segment	**Interior Slopes - Resultant Factor of Safety (FOS)**					**Figure Nos.**
	Short-Term (Undrained)	**Long-Term (Drained)**	**Rapid Drawdown (Undrained)**	**Max Still Water (Undrained)**	**Seismic (Undrained)**

3 (F-F')	1.47 (B)	1.96 (S)	1.45 (B)	1.45 (B)	0.97 (B)	**Figure 72** thru **Figure 76**
Req'd FOS	1.3	1.5	1.1	1.1	1.1	

Notes:
B = Block failure surface
S = Circular slip surface
I->O = Slip surface from Inboard to Outboard; and O->I: Slip surface from Outboard to Inboard

It is noted that the resultant FOS values under all design conditions, except for two cross sections A-A' (Segment-1) and F-F' (Segment-3) under seismic loading condition, are higher than the required values when the subgrade preparation/improvement as discussed in Section 4.2 is implemented.

The Newmark sliding block analyses per Martin and Qiu (Ref. 17) were performed for the two cases with the FOS less than 1.0 under seismic loading condition; (a) slope at cross section A-A' (slip surface from inboard to outboard) in Segment-1, and (b) slope at cross section F-F' (slip surface from inboard to outboard) in Segment-3. In this procedure, yield acceleration defined as PGA for which FOS = 1.0 for the slope is calculated. Martin and Qiu (Ref. 17) proposed the following simplified equation for deformation analysis:

$$d = 6.82\,(k_y / k_{max})^{-0.55}\,(1 - k_y / k_{max})^{5.08}\,A^{-0.86}\,V^{1.66}$$

where

d = permanent displacement (inch),

k_y = yield acceleration in units of g,

k_{max} = maximum seismic acceleration in the sliding block in units of g (provided in **Table 2**),

A = peak ground acceleration (in/sec^2), and

V = peak ground velocity (in/sec), where $ln(V) = 3.97 + 0.94ln(S_1) + 0.013(ln(S_1) + 2.93)^2 + 0.063M$, V is in units of cm/sec,

S_1 = spectral acceleration at 1 sec in units of g,

M = magnitude of design earthquake.

The yield acceleration for the cross sections A-A' and F-F' are estimated to be about 0.052g and 0.015g as shown in **Figure 48** and **Figure 71**, respectively. Based on the equation above, the lateral deformation along the cross section F-F' was estimated to be about 4 inches, and the lateral deformation along the cross section A-A' was about 1 inch under the seismic condition. It is considered that this magnitude of deformation under the seismic condition is acceptable. The analysis results for all the considered cases are summarized in **Table 6**.

Table 6: Summary of Deformation Analysis Results

Levee Segment / Cross Section	Martin and Qiu (Ref. 17)						Lateral Deformation (in) - Seismic	Figure Nos.
	k_y (g)	k_{max} (g)	A (in/sec^2)	V (in/sec)	S_1 (g)	M		
1 (A-A')	0.052	0.116	44.82	3.88	0.11	6.4	1.0	**Figure 48**
3 (F-F')	0.015	0.116	44.82	3.88	0.11	6.4	4.0	**Figure 71**

Notes:
Lateral deformation under seismic condition was estimated using the Newmark sliding block analyses (Ref. 17).

9.2 Levee Settlement

Based on the compressibility properties of the underlying soil layers, the settlements underneath the levee are estimated and the results are summarized in **Table 7** by considering various fill thicknesses. The thickness of the fill placed for the levee construction generally ranges from 16 feet to 23 feet.

In addition to the settlement due to compression of the subsurface soils, compression of levee under self-weight and secondary compression of upper soft clays will contribute to total settlement of the levee. It is estimated that the magnitude of settlement due to self-weight is about 1 percent of the levee height, per NAVFAC DM 7.02 (Ref. 18). Secondary compression of top soft clays is estimated and summarized in **Table 4** using the secondary compression index interpreted from the time-settlement curves of the incremental consolidation test data documented in Fugro's EPC Level Geotechnical Data Report (Ref. 1).

Table 7: Summary of Settlement Analysis Results

Levee Segment	Existing Grade EL. (ft)	Fill Thickness (ft)	(1)	(2)	(3)	(1)+(2)+(3)
			Total Primary Consolidation and Immediate Settlement in Subsurface Soils (in)	Secondary Compression in Subsurface Soils 30 yrs after Start of Levee Construction (in)	Creep Settlement within Levee Fill due to Its Self-Weight (in)	Total Settlement (primary consolidation, immediate settlement, plus long-term)
1	+1	22.6	36.0	3.0	2.6	41.6
	+3	20.5	35.0	3.4	2.3	40.7
	+5	18.4	33.6	3.7	2.1	39.4
	+7	16.2	31.3	4.0	1.8	37.1
2	+1	21.6	23.9	1.4	2.5	27.8
	+3	19.7	25.2	1.7	2.3	29.2
	+5	17.7	25.8	2.0	2.0	29.8
	+7	15.7	25.5	2.3	1.8	29.6
3	+1	22.5	35.2	3.1	2.6	40.9
	+3	20.5	34.4	3.4	2.3	40.1
	+5	18.4	33.1	3.7	2.1	38.9
	+7	16.2	30.9	4.0	1.8	36.7

NOTE: The results in this table indicate the estimated settlement at the center of the levee. Settlement at the toe can be estimated as about 55% of the center settlement.

Based on the analysis results in **Table 7**, the levee shall be constructed to at least 42 inches higher than the design elevation for Segment-1 and Segment-3, and at least 30 inches higher than the design elevation for Segment-2, to compensate for the long-term settlement and to ensure the levee top elevation will not be lower than the minimum design elevation during the operational period. Due to subsurface variability, settlements along the levee alignment vary and differential settlements should be expected. It is recommended that installation of settlement monitoring plates at minimum fifteen (15) locations along the

levee, and inclinometers and vibrating wire piezometers at minimum five (5) locations as described in Section 5.5.

10.0 CONCLUDING REMARKS

Geotechnical recommendations for subgrade preparation along the levee alignment have been developed to ensure stability of the levee during the service life of the facility. Calculations have been performed to demonstrate stability of levee and estimated settlement. The following conclusions are made:

1. The analyses show that the perimeter levee will be stable under all static loading conditions, when subgrade improvement as discussed in Section 4.2 are implemented. The levee will also be stable under the seismic loading condition with minor deformation.
2. The settlement in subsurface soils due to the placement of levee fill and creep settlement within levee fill itself are estimated. Levee Segment-1 and Segment-3 will experience primary consolidation and immediate settlement of 36 inches and secondary compression and creep settlement of 6 inches. Levee Segment-2 will experience primary consolidation and immediate settlement of 26 inches and secondary compression and creep settlement of 4 inches. Even though majority of primary consolidation settlement is expected to occur during construction due to the presence of wick drains, time rate of settlement will be a function of construction sequence. It is recommended that the total settlement values need to be considered for compensation fill to maintain the levee top elevation higher than the minimum design elevation. Note that these settlement values are best-estimated theoretical values and some percentages of total consolidation settlement will take place during construction period. Therefore, settlement monitoring during construction period is critical to assess the remaining settlement after construction.
3. Seepage inflow and blowout beneath the levee during storm surge events are not anticipated.

1.0 GENERAL

Port Arthur LNG, LLC (PALNG) is developing a Liquefied Natural Gas (LNG) production and export facility on a site located on the western shoreline of the Port Arthur Canal in Jefferson County, Texas.

To protect the LNG plant against storm surge events an earthen levee will be constructed around the perimeter of the plant (Figure 1). As per the Design Criteria for Civil Sitework (26196-100-3DR-C04-00001/ PAL-PJT-CIV-DEC-00-X-0001), it has been determined that the levee will be designed to withstand a 500-year return period storm surge event with associated wave conditions.

This document describes the Overtopping and Levee Elevation Assessment that has been carried out. The analysis for this assessment is based upon the 500-year storm surge conditions and wave parameters presented in the Moffatt & Nichol Shoreline Protection Report (PAL0-MAR-RPT-0012).

The report will also calculate the surface water depth above ground on the inside of the levee when limited overtopping of the levee is allowed, and consider the protection required on the front and rear side of the levee.

2.0 DESIGN CONDITIONS

The following section of this report presents the design conditions used for the overtopping and levee elevation assessment report. This section contains the met-ocean design conditions and the design assumptions made for the levee.

2.1 Met-ocean

Met-ocean design conditions specific to the PALNG project site were developed and presented in report the following reports:

- Marine Site Characteristics (Moffatt and Nichol; PAL0-10-MAR-RPT-0002)
- Shoreline Protection Report (Moffatt and Nichol; PAL0-MAR-RPT-0012)

The design water level and wave conditions used for the analysis in this report are presented in Table 1.

The 500-year wave condition used is taken directly from PAL0-MAR-RPT-0012, which describes that it has been derived using the USACE Automated Coastal Engineering System model.

The 500-year Still Water Elevation (SWEL) was defined in both PAL0-10-MAR-RPT-0002 and PAL0-MAR-RPT-0012.

As per the recommendations of PAL0-MAR-RPT-0012, this single wave height and wave period has been considered as the worst-case significant wave height that could affect the site in a 500-year event, and therefore has been used for the overtopping and levee elevation analysis.

It should be noted that, as per PAL0-10-MAR-RPT-0002, that the probability of the 500-year SWEL occurring at the same time as the wind conditions required to create the derived 500-year wave is smaller than the probability of any of these events taking place individually. Therefore, it can be concluded that the results used for this levee elevation analysis are conservative.

2.2 Relative Sea Level Rise

For the assessment of the levee elevation a Relative Sea Level Rise (RSLR) value of 0.6’ was used, based upon the information defined in both PAL0-10-MAR-RPT-0002 and PAL0-MAR-RPT-0012. This value was based upon analysis of the recorded mean sea level trend at NOAA CO-OPS Station 8770570 Sabine Pass North for the period 1958 to 2013, which reflects RSLR. The analysis showed a mean sea level trend of 0.25 in/year,

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. (“BEINC”). All rights reserved.

and therefore a loss in elevation relative to mean sea level of 0.6’ over a 30-year design life of the facility can be expected.

In addition to this, the design elevation of the levee was also checked against a Federal Energy Regulatory Commission (FERC) provided value for RSLR. This value was taken from the USACE Sea Level Change Curve Calculator which uses the same NOAA CO-OPS data to develop RSLR predictions using IPCC scenarios for increased future rates of sea level rise. For the intermediate scenario a RSLR of 1.21’ for a 30-year design life was provided by FERC.

2.3 Design Conditions

Design water levels considering both RSLR values have been studied in this updated report. These water levels, together with the associated 500-yr wave conditions, are provided in Table 1.

Table 1 Storm Surge, RSLR and Wave conditions for Levee Elevation analysis

	Storm Surge (ft. NAVD88)		**500-yr Wave Heights, H_s (ft)**	**500-yr Wave Periods, T_p (s)**
	SWEL (500-yr)	*SWEL+ RSLR*		
Baseline	+14.00	+14.60	5.9	4.0
FERC RSLR	+14.00	+15.21	5.9	4.0

2.4 Levee Design

Shoreside and landside elevations for the PALNG levee will be considered using the 500-year event wave height and period specified in PAL0-MAR-RPT-0012. The assumption in PAL0-MAR-RPT-0012 that the relocated Highway 87 would act as a wave breaking barrier and reduce the incident wave height at the shoreside levee is now no longer valid.

The latest State of Texas plans for proposed Highway 87 developments (State of Texas, 2018) show that the roadway elevation in front of the shoreline levee will be approximately +7.5’ NAVD88. Given this elevation and considering the same theory for wave breaking applied in the Moffat and Nichol Shoreline Protection Report (PAL0-MAR-RPT-0012), the worst-case wave height that may affect the land side of the levee will be in the order of 5.7’. This assumes a maximum wave height of 80% of the water depth over the highway (including predicted relative sea level rise). A similar wave period as presented in Table 1 would be expected. Based upon the analysis from the PALNG Substation elevation analysis (308005-00087 - 00-CS-REP-0001), this can be taken as a conservative wave

height for the landside levee at this stage. The substation report suggests a 500-year wave height of 5.2' with a wave period of 3.2 seconds.

The angle of wave approach to the levees is described in the Moffatt and Nichol report PAL0-MAR-RPT-0012, and it is concluded that there is no case where the worst design wave condition will impact the levee in a head-on direction. Upon review, this assumption seems logical based upon the derivation of wave heights relying upon a fully developed wave occurring in either direction of the existing navigation channel. Therefore, a wave attack angle reduction factor (γ_β) of 0.85 will be used as per PAL0-MAR-RPT-0012.

For derivation of run-up and overtopping, it is assumed that the levee will be protected by a grass layer with a grass length greater than 0.1'. Therefore, as per the USACE Coastal Engineering Manual (USACE, 2003), the surface roughness reduction factor (γ_r) should be between 0.9 and 1.0. A value of 0.9 was used in these overtopping calculations as this provides some allowance for the effects of the with High Performance Turf Reinforcement Matting (HPTRM) that will be used for additional erosion protection.

For calculation of wave run-up and overtopping, it is assumed that the levee will be constructed with a 3 (Horizontal): 1 (Vertical) front side slope, and no berm in front of the slope has been considered. As a minimum, both the front and rear side of the levee will be protected with HPTRM around its full length.

3.0 METHODOLOGY

3.1 Levee Elevation

For the 500-year design case to determine levee elevations, a no-overtopping and overtopping allowed case were considered. For an allowable overtopping case, discharge should be limited to around 0.1 cfs/ft (10 l/s/m). This is as per USACE Coastal Engineering Manual guidelines for mean overtopping discharge over a clay levee with grass coverage to maintain structural stability, but does not account for additional erosion protection such as HPTRM.

For a no overtopping case, this elevation was considered as 1' above the run-up elevation of the largest 2% of the waves that may occur during the 500-year event. The methodology for determining these is explained in more detail in this section.

It is noted that a more recent EurOtop manual was released in December 2018 (EurOtop, 2018) than that used for the Moffatt & Nichol analysis (EurOtop, 2007). For this type of run-up and overtopping analysis the differences in calculated results between the use of the 2007 formula and the 2018 formula is minimal (see section 8.2 of 2018 EurOtop

manual). To keep with the most recent overtopping guidance, analysis within this report will consider the EurOtop 2018 manual.

3.1.1 Considering Allowable Overtopping

To assess the required crest elevation to protect against run-up from a 500-year storm event a run-up and overtopping analysis was performed. This analysis followed the best practice of the EurOtop manual (2018) and the USACE Coastal Engineering Manual (2003).

Levee elevations were set at an elevation that limited the base case RSLR case (0.6') overtopping to below 0.1 cfs/ft, as per the Design Criteria for Civil Siteworks (26196-100-3DR-C04-00001). This value is defined in the USACE Coastal Engineering Manual as 'the start of damage' for a grass covered clay levee, which is generally acceptable when designing for such a low probability design event. The 500-year design event has a 0.2% chance of occurring in any year of the design life of the LNG plant. Note that an overtopping value of 0.1 cfs/ft does not consider any reinforcement to the grass coverage, such as High-Performance Turf Reinforcement Matting (HPTRM), which would provide further protection from erosion and therefore allow additional overtopping.

This value of 0.1 cfs/ft has been widely studied by the USACE, and was the value used for probabilistic design of earthen levees in the New Orleans area after Hurricane Katrina for 100-year design events.

The method for calculating overtopping is described in Formula (1). RSLR was included in the calculation to ensure the levee defends against predicted sea level rise and global subsidence over the lifetime of the project, as per PAL0-10-MAR-RPT-0002. As the design of the PALNG levee is using a deterministic approach, the deterministic overtopping design formula from the EurOtop manual has been used, rather than the probabilistic formula, which adds a partial safety factor of one standard deviation.

$$\frac{q}{\sqrt{gH_{m0}{}^3}} = \frac{0.026}{\sqrt{\tan\alpha}}\gamma_b\varepsilon_{om}exp\left[-\left(2.5\frac{R_C}{\varepsilon_{om}\gamma_b\gamma_r\gamma_\beta\gamma_v}\right)^{1.3}\right] \quad (1)$$

Where;

q	= Mean overtopping volume;	γ_r	= Surface roughness reduction factor
γ_b	= Levee reduction factor;	γ_β	= Wave attack angle reduction factor
γ_v	= Wave wall reduction factor;	R_c	= Freeboard above SWEL
ξ_{om}	= Iribarren Number;	H_{m0}	= Significant wave height (structure)

In addition to the baseline calculation, the calculated levee elevation was then checked against the alternate RSLR value provided by FERC. This check was done to make sure that average overtopping remained close to the 0.1 cfs/ft range, and also that overtopping flow velocities were below the erosion threshold offered by the HPTRM protection (see Section 3.2 for more details on flow velocities).

3.1.2 No Overtopping

Based upon FEMA (2007) guidelines for levee elevations and 44 CFR 65.10, for a 100-year storm event a no overtopping scenario is defined as the maximum 2% wave run-up elevation with an additional 1' of freeboard. Therefore, to consider no overtopping in a 500-year event for the PALNG a similar approach was used. Using formula for a 2% run-up elevation from the EurOtop manual (2018), the levee elevation for a 500-year event for no overtopping was determined as per formula (2) and formula (3). For the design approach, the effects of RSLR were also included in setting the levee elevation for no overtopping.

$$R_{2\%} = H_{m0} * 1.75\gamma_b\gamma_\beta\gamma_f\varepsilon_{m0} \quad (2)$$

$$No\ Overtopping\ Levee\ Elevation = 500yr\ SWEL + RSLR + R_{2\%} + 1' \quad (3)$$

In addition to the method outlined in Formula 3, the 2018 EurOtop manual also provides some guidance as to what value of overtopping, using calculations from Formula 1, actually can be defined as a 'zero overtopping' scenario. Following these guidelines, 'zero overtopping' can be described as the following:

When H_{m0} = 1m (3.28'), q = 0.03 l/s per m (0.0003 cfs/ft) *(4)*

When H_{m0} = 3m (9.84'), q = 0.16 l/s per m (0.0017 cfs/ft) *(5)*

Therefore, considering a 500 yr wave height of 5.9' (1.8m), by following EurOtop guidance 'zero overtopping' for the PALNG levee will be achieved when Formula 1 shows overtopping of less than or equal to 0.0003 cfs/ft.

3.2 Overtopping Velocity

In addition to calculation of average overtopping volumes, a calculation was also performed to determine the velocity of the overtopping flow on the protected, inside slope of the levee. This was done to confirm that overtopping velocities were below the specified capacity of the HPTRM, and therefore below the erosion threshold for the levee. As shown in Appendix A, there critical velocity threshold for vegetated HPTRM is 25 ft/sec.

Overtopping flow velocity was calculated by following the methodology presented in the USACE Technical Note on Estimate of Overtopping Flow Velocities on Earthen Levees (USACE, 2008).

3.3 Calculation of surface water depth above ground with overtopping

As per the Design Criteria for Civil Sitework (26196-100-3DR-C04-00001), for the 500-year event where overtopping was allowed for an average of around 0.1 cfs/ft, average surface water depth above ground was calculated based upon the duration of a two-hour, 500-year storm event. Two hours was selected as it was identified as the typical duration for peak winds speeds, as opposed to peak storm surge duration, to occur during a hurricane (Giammanco et al., 2005).

When calculating total discharge over the levee and potential water accumulation within the LNG plant area, overtopping of all the levee at the same time was not considered a realistic scenario. Therefore, potential surface water depth within the levee was considered by calculating total overtopping over either the shoreside or landside levee section, which are defined in Figure 2.

The average surface water depth was calculated by dividing the total overtopping discharge over the full storm event by the total area footprint within the levees, with no consideration of drainage or pump out of overtopped water. Total overtopping discharge was calculated using the method described in Chapter 5.5.2 of the EurOtop Manual (2018), which has been adopted as a reliable and realistic method for calculation. This method uses a method whereby the distribution of individual overtopping waves volumes can be represented by the two parameter Weibull probability distribution, given by the percent exceedance distribution show in Equation 6.

$$P_{V\%} = P(V_i \geq V) = exp\left[-\left(\frac{V}{a}\right)^b\right] \blacksquare (100\%) \quad and \quad P_{V\%} = P_V \blacksquare (100\%) \tag{6}$$

P_V is the probability (between 0 and 1) that an individual wave volume (V_i) will be less than a specified volume (V), and $P_{V\%}$ is the percentage of wave volumes that will exceed the specified volume (V). The two parameters of the Weibull distribution are the non-dimensional shape factor, b, that helps define the extreme tail of the distribution and the dimensional scale factor, a, that normalizes the distribution.

In previous revisions of this report, a more conservative approach of multiplying the full average discharge over a complete 2 hours storm duration were used, however since this report was first issued this method is now obsolete.

4.0 RESULTS

4.1 Baseline Levee Elevation

The results from the levee run-up and overtopping analysis are presented in Table 2. This table shows the required levee elevation for the following two scenarios:

- Scenario 1: Allowable average overtopping limit of 0.1 cfs/ft (500-year storm event) using baseline RSLR of 0.6' over 30-year Project life;
- Scenario 2: No overtopping allowed (500-year storm event), as per Formula 3;
- Scenario 3: No overtopping allowed (500-year storm event), as per Formula 4.

The levee elevation refers to both the shoreside and landside PALNG levee as there is no difference in design conditions between the two levee sections. Both Scenario 1 and Scenario 2 results consider the long-term effects of RSLR.

Table 2 Levee Elevations for Scenario 1 and Scenario 2

	Surge Elev. + RSLR (ft. NAVD88)	H_{m0} (ft.)	T_p (s)	Final Levee Elevation (ft. NAVD88)
Scenario 1	+14.6	5.9	4.0	+20.6
Scenario 2	+14.6	5.9	4.0	+25.1
Scenario 3	+14.6	5.9	4.0	+26.8

4.2 RSLR Elevation Check

As noted in Section 3.1.1, an additional check was made to ensure that, when using the FERC provided RSLR value, the average overtopping velocities remained in the range of the target 0.1 cfs/ft. Table 3 compares the overtopping values for this check against the overtopping values calculated in the baseline Scenario 1.

Table 3 Average Overtopping Volume (cfs/ft) for Baseline and FERC RSLR Scenarios

	500-yr SWL (ft. NAVD88)	RSLR (ft.)	H_{m0} (ft.)	T_p (s)	Levee Elevation (ft. NAVD88)	Average Overtopping Volume (cfs/ft)
Baseline	+14.0	0.60	5.9	4.0	+20.6	0.09
FERC	+14.0	1.21	5.9	4.0	+20.6	0.13

© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

4.3 Overtopping Velocities

Following the methodology provided in Section 3.2, overtopping velocities for the rear, protected side of the levee were calculated for both the baseline RSLR scenario and also the FERC RSLR scenario. Results for these calculations are provided in Table 4.

Table 4 Protected Levee Side Overtopping Flow Velocities for Baseline and FERC RSLR Scenarios

	500-yr SWL (ft. NAVD88)	RSLR (ft.)	Levee Elevation (ft. NAVD88)	Overtopping Flow Velocity (ft/sec)
Baseline	+14.0	0.60	+20.6	16.6
FERC	+14.0	1.21	+20.6	18.5

As can be seen from this table, both scenarios result in an overtopping flow velocity being less than the erosion threshold of 25 ft/sec for the HPTRM.

4.4 Surface Water Levels from Overtopping

Surface water levels from overtopping were calculated using the updated methodology described in Section 3.3, for both shoreside and landside levee sections (see Figure 2). Total overtopped volume was determined over a storm duration of two hours, and then divided by the total footprint within the levee (approx. 281 acres) to calculate the average depth of the overtopped water across the project site. These values are provided in Table 5 for both the Baseline and FERC RSLR scenarios.

Table 5 Estimate surface water depth within the PALNG levee after a 500-year storm (no drainage)

	Levee Section Length (ft)	Total Water Volume (gallons)	Total Surface Water Depth
Shoreside Baseline	7,854	552,960	< 0.1”
Landside Baseline	8,376	589,710	< 0.1”
Shoreside Baseline	7,854	595,750	< 0.1”
Landside Baseline	8,376	635,342	< 0.1”

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. (“BEINC”). All rights reserved.

As can be seen from the results, the total surface water depth using the update calculation method is less than 0.1” for both of the RSLR scenarios. This compares to a calculated depth of around 5” using the previous method, which significantly overestimates total overtopping volume.

5.0 LEVEE PROTECTION REQUIREMENTS

The levee that surrounds the PALNG plant will provide defense against storm surge and hurricane events, and therefore needs to be adequately protected to prevent levels of erosion that may compromise its integrity.

As part of this overtopping and levee elevation assessment, the effects of wave-induced erosion that would be expected to occur on the front side of the levee during a 500-year storm was considered. Guidance on the requirements for front side levee protection was taken from the USACE (2010), where several design methods were compared for a grass covered earthen clay levee. Note that the analysis undertaken by the USACE did not consider the use of HPTRM on the front side of the levee, which will provide further resistance against erosion.

The final conclusions that are listed in Section 8 (page 102) of the USACE study can be applied to the PALNG levee design, as the following criteria will apply to the levee design:

- Earthen levees are constructed of good quality clay with low sand content;
- The average wave overtopping discharge is less than 2.8 cfs/ft (PALNG average wave overtopping is limited to 0.1 cfs/ft);
- Peak surge and wave duration is less than 10 hours (PALNG peak wind conditions estimated to be approximately two hours as per Giammanco et al., 2005).

Given these above parameters, the following conclusions made by the USACE can be applied to the PALNG project:

1. With a reasonable degree of certainty, flood side armoring is not required where significant wave heights (H_s) are not expected to exceed 4.9’ (1.5m);
2. With less degree of certainty, flood side armoring is not required where significant wave heights (H_s) are not expected to exceed 8.0’ (2.44m);
3. Levees will possibly be able to withstand significant wave heights (H_s) greater than 8.0’ (2.44m) without flood side armoring.
4. Armoring of the front side of the levee is only justified when armoring of the land side of the levee is required, from an overtopping perspective. That is, before damage to

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.

Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. (“BEINC”). All rights reserved.

the front side would become critical the rear side of the levee will already have sustained severe damage.

Given the design significant wave height (H_s) for the PALNG levee is 5.9' during a 500-year event it can be concluded that, with a degree of certainty closer to that of conclusion 1 than conclusion 2, flood side armoring for the PALNG levee is not required. The additional use of the HPTRM on the flood side of the levee will also prevent any significant erosion that may occur during a 500-year event.

In addition to this the levee elevation will be, at a minimum, designed to limit overtopping to an average of 0.1 cfs/ft. This value was chosen as it has been shown in research that rear-side levee erosion caused by this level of overtopping will not threaten the overall stability of a grass covered earthen clay levee. The additional stability provided by the HPTRM of the rear side of the levee will also prevent any significant erosion as a result of overtopping during a 500-year storm event. Therefore, based upon the USACE conclusion 4, front-side levee armoring is not required as the rear-side levee stability will not be compromised in a design event. It has also been shown by the results in Section 4.3 that the velocity of the overtopping flow on the rear side of the levee will be well below the critical erosion threshold provided by the additional protection of the HPTRM.

Both the front and rear sides of the PALNG levee should be protected with High Performance Turf Reinforcement Matting, which is anchored into the levee. This material will provide additional resistance against potential erosion during large storm events, such as the 500-year design conditions. As per the velocities shown in Section 4.3 and the information provided in Appendix A of this report, the HPTRM will be able to resist the expected run-up and run-down velocities from the wave surge and overtopping.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The following conclusions and recommendations can be drawn from this report:

A. The analysis to set the elevation of the PALNG levee has considered one 500-yr design scenario (SWEL, RSLR, H_s and T_p) for the shoreside and landside levee sections. There is no design case for having different elevations.

B. Considering the Design Criteria for Civil Sitework (26196-100-3DR-C04-00001), the PALNG levee should have a minimum elevation of +20.6'. This result in an overtopping rate of approx. 0.1 cfs/ft which would over a duration of 2 hours during a 500-year storm event that considers a Baseline RSLR scenario (0.6').

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2019, 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

C. When considering overtopping during a 500-yr storm event, and assuming no drainage or pump out of the overtopped water, a maximum average surface water depth across the interior of the levee of less than 0.5” may be expected.

D. Analysis of the FERC provided RSLR value of 1.21’ was undertaken to check the suitability of the baseline design should such a scenario occur during the project design life. As a result of this check the following can be concluded:

   i. Average overtopping volumes would not significantly exceed 0.1 cfs/ft

   ii. Overtopping flow velocities on the rear side of do not exceed the HPTRM critical erosion threshold.

   iii. Total overtopping volume over the duration of a 2-hour storm would result in a overall flood depth inside the levee of less than 0.5”.

E. The levee elevation of +20.6’ NAVD88 is suitable for both the Baseline (0.6’) and FERC (1.21’) Relative Sea Level Rise scenarios.

F. Based upon guidance from the USACE (2010), no rock armoring of the front side or rear side of the levee is required.

G. The front and rear side of the levee should be protected with High Performance Turf Reinforcement Mats to reduce the risk of erosion in a storm or overtopping event. The use of such matting also provides an additional level of protection in the event of localized poor grass coverage, poor grass establishment and lapsed levee maintenance over the lifetime of the project.

NOTES:

1. The property values listed above are effective 03/09/2018 and are subject to change without notice. Values represent testing at time of manufacture.
2. Minimum average roll values (MARV) are calculated as the typical minus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any samples taken from quality assurance testing will exceed the value reported.
3. Maximum Average Roll Value (MaxARV), calculated as the typical plus two standard deviations. Statistically, it yields a 97.7% degree of confidence that any sample taken during quality assurance testing will meet to the value reported.
4. Typical Value.
5. Maximum permissible velocity and shear stress has been obtained through vegetated testing programs featuring specific soil types, vegetation classes, flow conditions, and failure criteria. These conditions may not be relevant to every project nor are they replicated by other manufacturers. Please contact Propex for further information.
6. Calculated as typical values from large-scale flexible channel lining test programs with a flow depth of 6 to 12 inches.

ARMORMAX® 75 ON A SLOPE FOR SLOPE STABILITY (STRUCTURAL APPLICATION) GENERAL INSTALLATION GUIDELINES

GENERAL NOTES

1. ARMORMAX® 75 is an engineered solution used for permanent erosion protection or surficial slope stability in vegetated and unvegetated applications. It is composed of two components: PYRAMAT® 75 High Performance Turf Reinforcement Mat (HPTRM) and Engineered Earth Anchors. ARMORMAX® 75 is available in green or tan to provide for an aesthetically pleasing solution with proven performance.
   1.1. PYRAMAT® 75 HPTRM is a three-dimensional, lofty, woven polypropylene geotextile that is available in green or tan which is specially designed for erosion control applications on steep slopes and vegetated waterways. The matrix is composed of polypropylene monofilament yarns featuring X3® technology woven into a uniform configuration of resilient pyramid-like projections. The material exhibits very high interlock and reinforcement capacity with both soil and root systems, demonstrates superior UV resistance, and enhances seedling emergence.
   1.3. The Type B2 anchor model is used for surficial slope stability applications and has a working load of up to 1,500 lbs. The Type B2 anchor consists of a die cast aluminum anchor head, zinc-aluminum coated carbon steel cable, a die cast zinc load-locking mechanism with a ceramic roller, and two aluminum ferrules. The bullet nose design of the anchor head allows the anchor to penetrate HPTRM resulting in minimal installation damage. The Type B2 anchor is also designed with a recessed cavity so the top of the cable can be cut below the surface being protected.
2. The 12", 18", and 24" Securing Pins are composed of a wire, mushroomed at the top. A washer is then placed on the wire and the wire is crimped or swedged about 3-1/2" below the top so the washer will not slide off. The end of the wire is cut at a 45 degree angle for easy penetration of the soil. These Pins with washers conform to industry standards for erosion control pins with washers.
3. LANDLOK® S2 Erosion Control Blankets consist of 100% wheat straw mechanically bound and covered on both sides by netting. The straw is homogeneously blended and evenly distributed throughout the blanket. The netting is photodegradable polypropylene with mesh openings of approximately 3/8 in. by 3/8 in. (11 mm by 11 mm). The blanket is sewn on approximately 2 in. (51 mm) centers with photodegradable polypropylene thread. This product is NTPEP approved for AASHTO standards.

VEGETATION ESTABLISHMENT

4. Prepare seedbed by loosening 50 to 75 mm (2 to 3 in) of soil above final grade. Apply seed in an amount equivalent to 60% of the total mixture required to be installed on the soil surface, to scarified surface prior to installation of the ARMORMAX® 75. Select and apply soil amendments and fertilizer, to scarified surface prior to installation of the ARMORMAX® 75. A site specific soil test should be performed to help determine what soil amendments, such as lime and fertilizer, need to be incorporated into the soil to promote healthy vegetation.
5. The installed ARMORMAX® 75 shall be soil filled and seeded with the remaining 40% of the seed mixture. Do not place excessive soil above material. Once soil fill and additional seed is in place, surficial protection should be accomplished by installing LANDLOK® S2 Erosion Control Blanket (ECB) atop the seed layer. LANDLOK® S2 ECB is to be secured using 6" U-shaped staples with a frequency of 2.0 staples per square meter (1.7 staples per square yard).
6. Irrigate as necessary to establish and maintain vegetation until 75% of vegetation has established and has reached a height of 2 inches. Frequent, light irrigation will need to be applied to seeded areas if natural rain events have not occurred within two weeks of seeding.

BEFORE INSTALLATION BEGINS

7. Coordinate with a Propex Representative: A pre-construction meeting is suggested with the construction team and a representative from Propex. This meeting should be scheduled by the contractor with at least a two week notice.
8. Gather the Tools Needed: Tools that you will need to install ARMORMAX® 75 include a pair of industrial shears to cut PYRAMAT® 75, tape measure, percussion hammer (sized appropriately for the anchors), ground rod driver compatible with the percussion hammer, drive steel compatible with the anchor, setting tool to set and load-lock the anchor, and wire cutters to cut the cable tendon of the anchor. If anchors will be load tested during construction, additional testing equipment may be necessary. Consult the "Anchor Load Test Manual" from Propex for further guidance. Available for purchase from Propex are drive steel, setting tools, and wire cutters.
9. Determine how to Establish Vegetation: The method of vegetation establishment should be determined prior to the start of installation. Different vegetation establishment methods require different orders of installation. Refer to Establish Vegetation for further guidance.
10. Please consult the Propex Website for the most up to date installation guidelines.

1.0 DESIGN BASIS

1.1 Purpose and Scope

The purpose of this calculation is to determine the water surface for higher intensity storms within the berm for the current plot plan.

- The water surface elevations within the berm will be estimated for the 100-year 24 hr ARI storm, with all stormwater pump running.
- The water surface elevations within the berm will be estimated for the 500-year 24 hr ARI storm, with all stormwater pump running and will be compared to the non-critical equipment point of support elevations.
- The water surface elevations will be estimated for the 100-year 7-day ARI storm, considering overtopping and stormwater pumps not operating and will be used to determine the minimum Critical Equipment Point of Support elevations.
- The basis for this analysis is based on Plot Plan E.

3.0 DESIGN PHILOSOPHY & CALCULATIONS

3.1 Project Background

PALNG is located on a tract of land on the Sabine-Neches Waterway to the west of Port Arthur Ship channel. The project site is between Port Arthur and Sabine Pass.

3.2 Datum

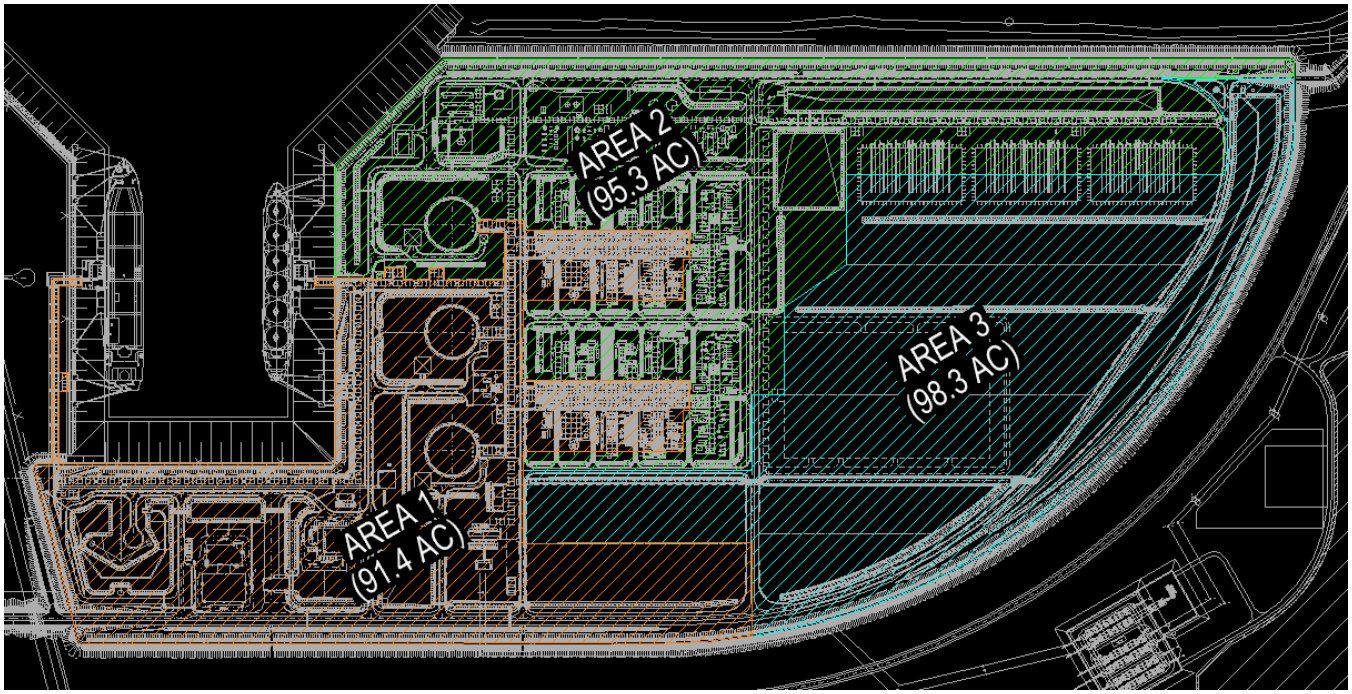
Site coordinates and elevations are based on plant datum (as mentioned in drawing 26196-100-C0-0000-00001).

3.3 Rainfall Data

The IDF curve utilized for this analysis is for the 100- and 500- year storm event, as per the Design Criteria for Civil Sitework (Reference 2.1.2).

3.4 Determine 100 and 500-Year 24 Hour Peak Flow

The area within the berm consists of 3 main drainage systems. Each drainage system has detention ponds and stormwater pumps to store and pump the stormwater over the berm during a rainfall event. See below for drainage area map.



The 100 and 500-year 24- hour hydrographs for each area were determine using WinTR-55. See below for WinTR-55 parameter and outputs.

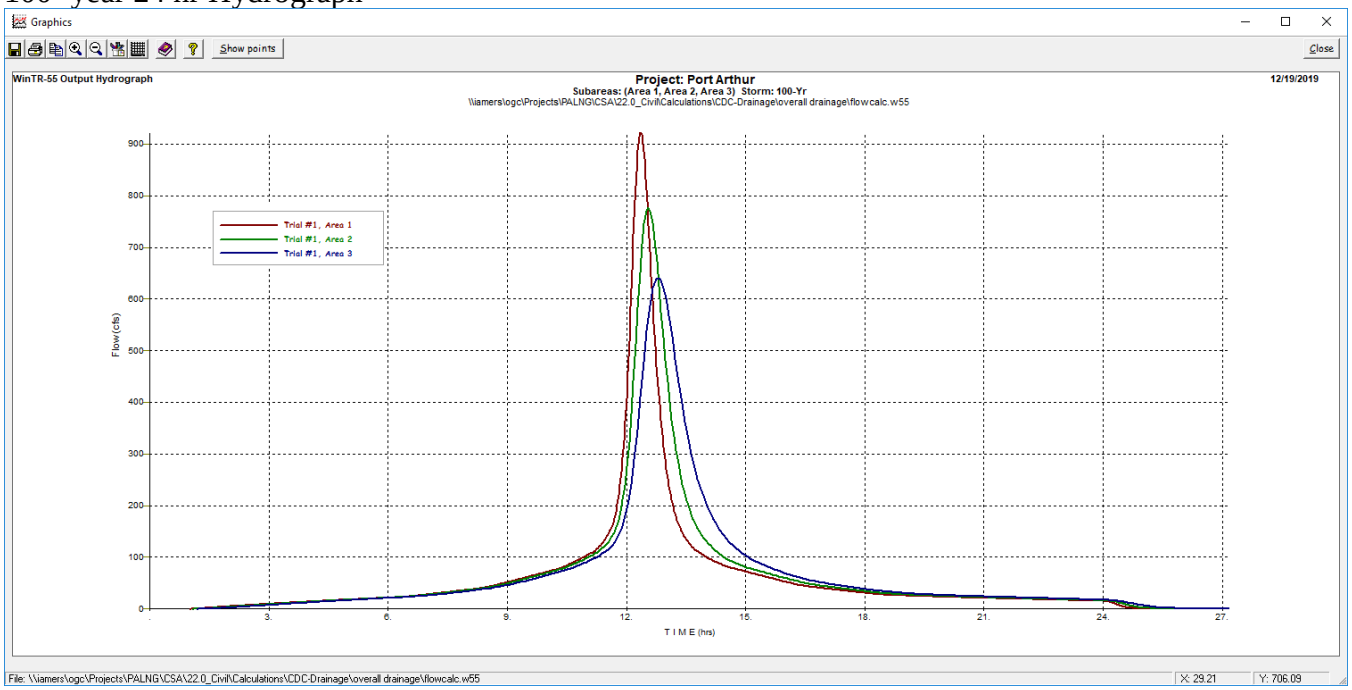
Verify 100-year rainfall volume obtained from WinTR-55 hydrographs with rainfall depth (NOAA Atlas 14) x area:

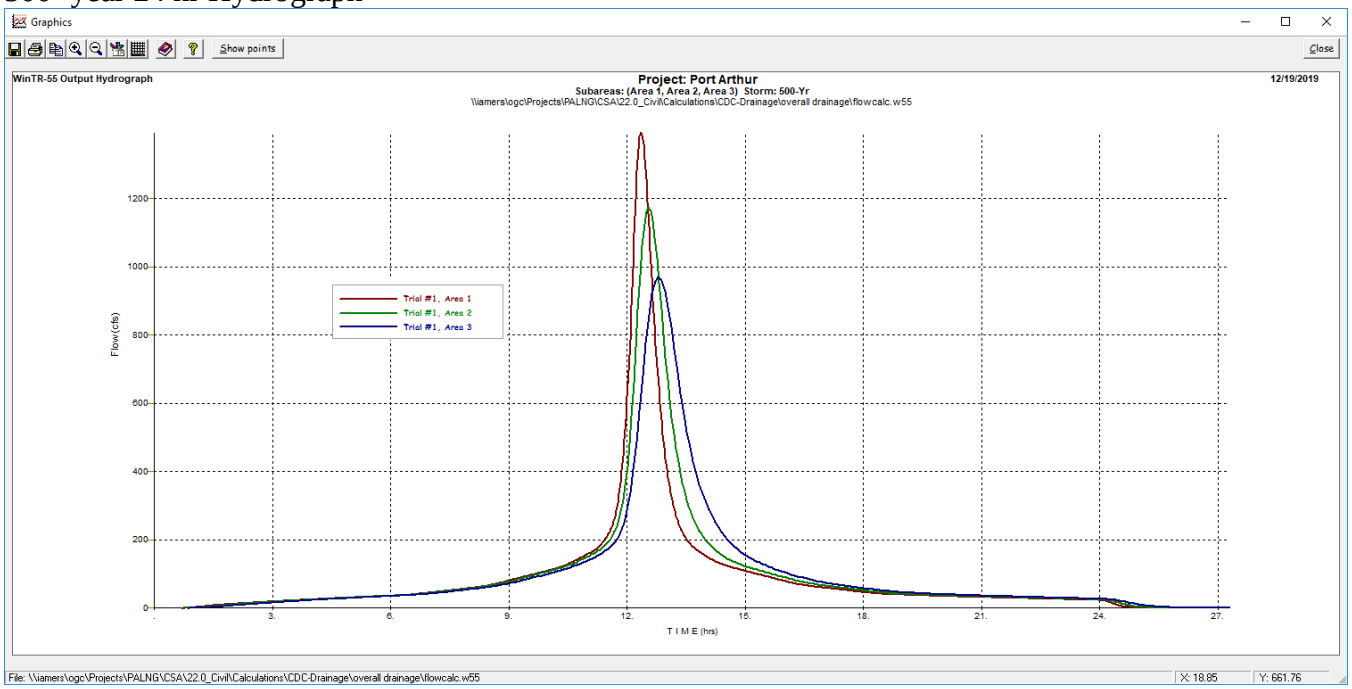
Drainage ID	C value	Area (acreage)	100yr Rainfall Depth (in)	100yr Rainfall Volume (cf)	100yr Rainfall Volume from WinTR-55 Hydrograph (cf)	% Difference
Area 1	0.9	91.4	18.4	5,494,310	5,815,417	2.8
Area 2	0.9	95.3	18.4	5,728,750	6,062,885	2.8
Area 3	0.9	98.3	18.4	5,909,088	6,254,167	2.8

Volume of from the WinTR-55 hydrographs computed (see page 11-15) are comparable to rainfall depth volumes and are adequate for this analysis.

100- year 24 hr Hydrograph



500- year 24 hr Hydrograph



3.5 Determine 100 and 500-Year 24 Hour Rainfall Volume and Depth

The 100-year ARI storm volume and water surface elevation for each area will be evaluated to determine if there are any impacts to the site.

The 500-year ARI storm water surface elevation will be compared to the minimum Non-Critical Equipment Point of Support elevation. From the design criteria, Non-Critical Equipment Point of Support shall be at or above 500-year ARI storm water surface elevations, with all pumps running. All Non-Critical Equipment Point of Support has been set to minimum elevation of 8.0'.

Based on the hydrograph shown above and with 133 cfs (60,000 gpm) pump out for each drainage area, the required storage was determined below.

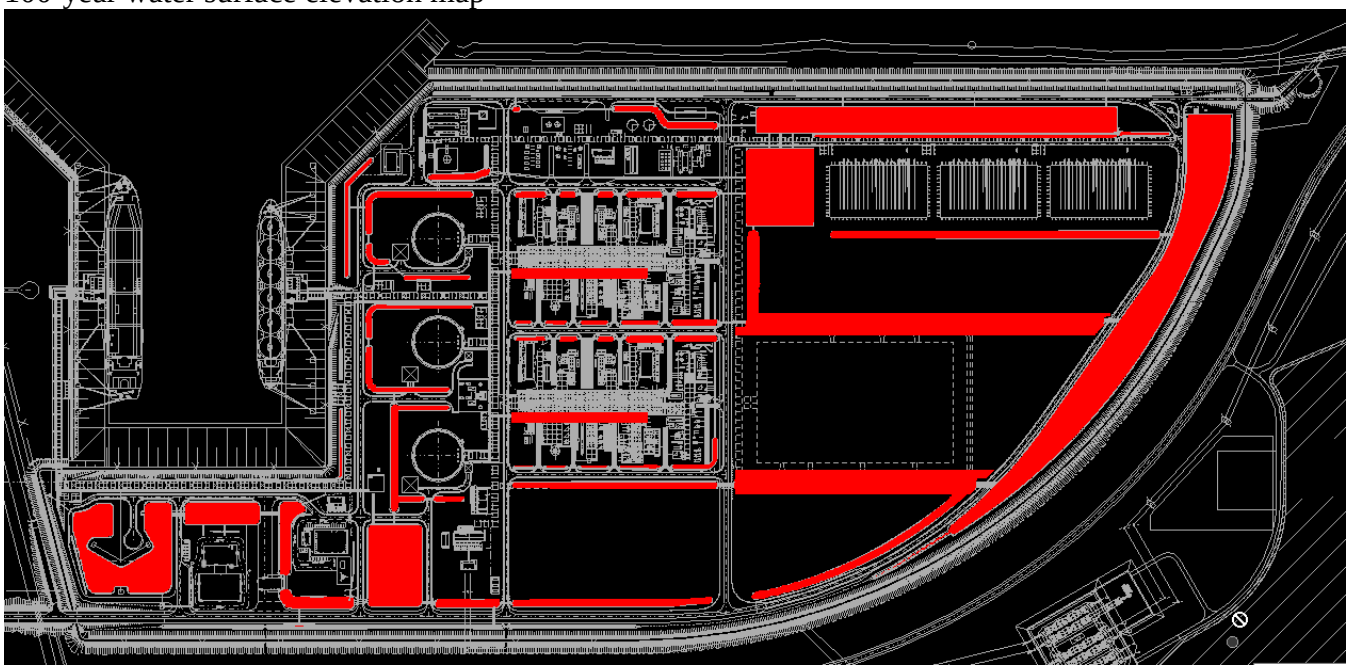
9	13870612

The storage volumes and water surface elevations for each area are summarized below.

Based on the Stage Storage table and the 100-year required volumes, the 100-year elevation in the berm for each area as follow:
Area 1 - 100-year required volume (with 133 cfs pump out) = 2,048,383 cf = elev 5.35'
Area 2 - 100-year required volume (with 133 cfs pump out) = 2,141,291 cf = elev 5.40'
Area 3 - 100-year required volume (with 133 cfs pump out) = 2,178,822 cf = elev 5.16'
See below for the 100-year inundation with in the berm.
The estimated average time it will take to drain the volume = 2,048,383 +2,141,291 +2,178,822 = 6,368,496 cf / (133 cfs x3)= 4.4 hrs

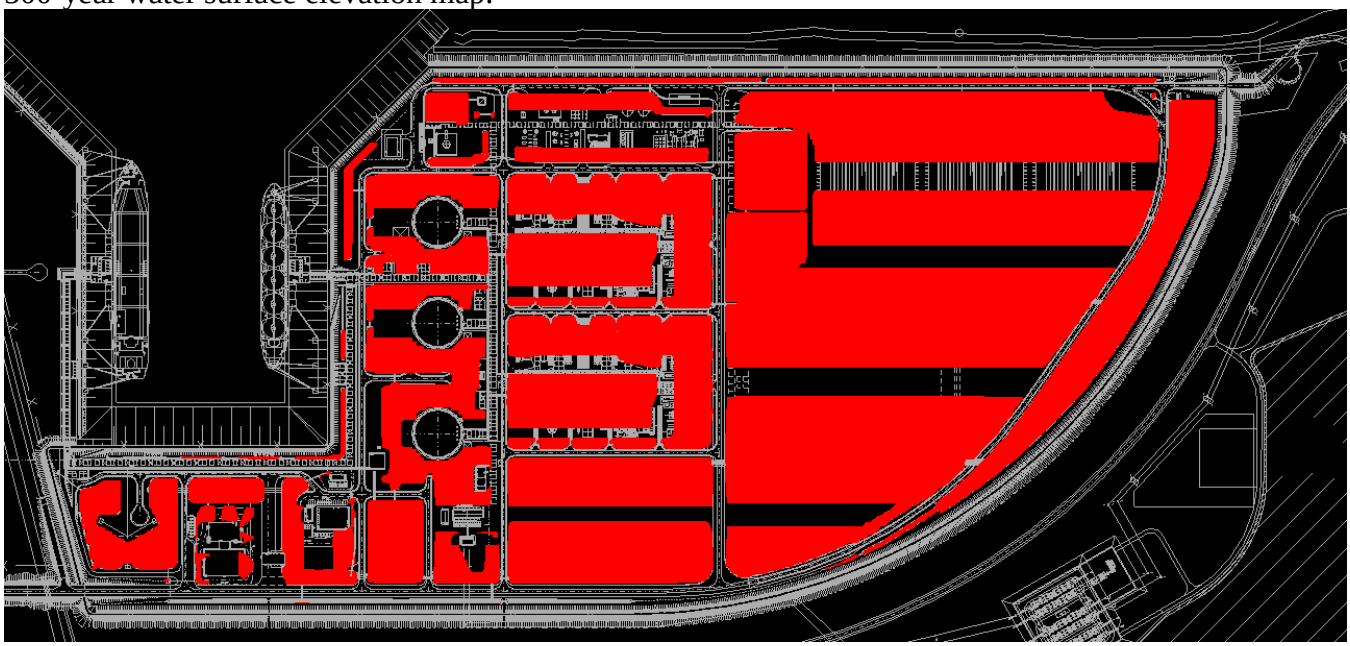
100-year water surface elevation map



Based on the 500-year required volumes, the 500-year elevation in the berm for each area as follow:
Area 1- 500 year required volume (with 133 cfs pump out) = 3,771,967 cf = elev 6.79'
Area 2- 500 year required volume (with 133 cfs pump out) = 3,997,274 cf = elev 6.74'
Area 3- 500 year required volume (with 133 cfs pump out) = 4,149,355 cf = elev 6.45'
All elevation is below the Non-Critical Equipment Point of Support minimum elevation of 8.0'.
See below for the 500-year inundation with in the berm.

The estimated average time it will take to drain the volume = 3,771,967+3,997,274+4,149,355 = 11,918,596 cf / (133 cfs x3)= 8.3 hrs

500-year water surface elevation map.



3.6 Determine 100-Year 7-day Rainfall Volume and Depth with Levee Overtopping and Stormwater Pumps Not Operating

The 100-year 7-day period storm with levee overtopping and stormwater pumps not operating will be used to determine the minimum Critical Equipment Point of Support elevation.

The rainfall depth for the 100-year 7-day period storm is 26.6 in.

Determine the rainfall volume for each area:
Area 1- 91.4 * 43560 * 0.98 * 26.6 / 12 = 9,017,938 cf
Area 2- 95.3 * 43560 * 0.98 * 26.6 / 12 = 8,648,893 cf
Area 3- 98.3 * 43560 * 0.98 * 26.6 / 12 = 9,301,818 cf
Total 100-year 7-day period volume= 26,968,649 cf

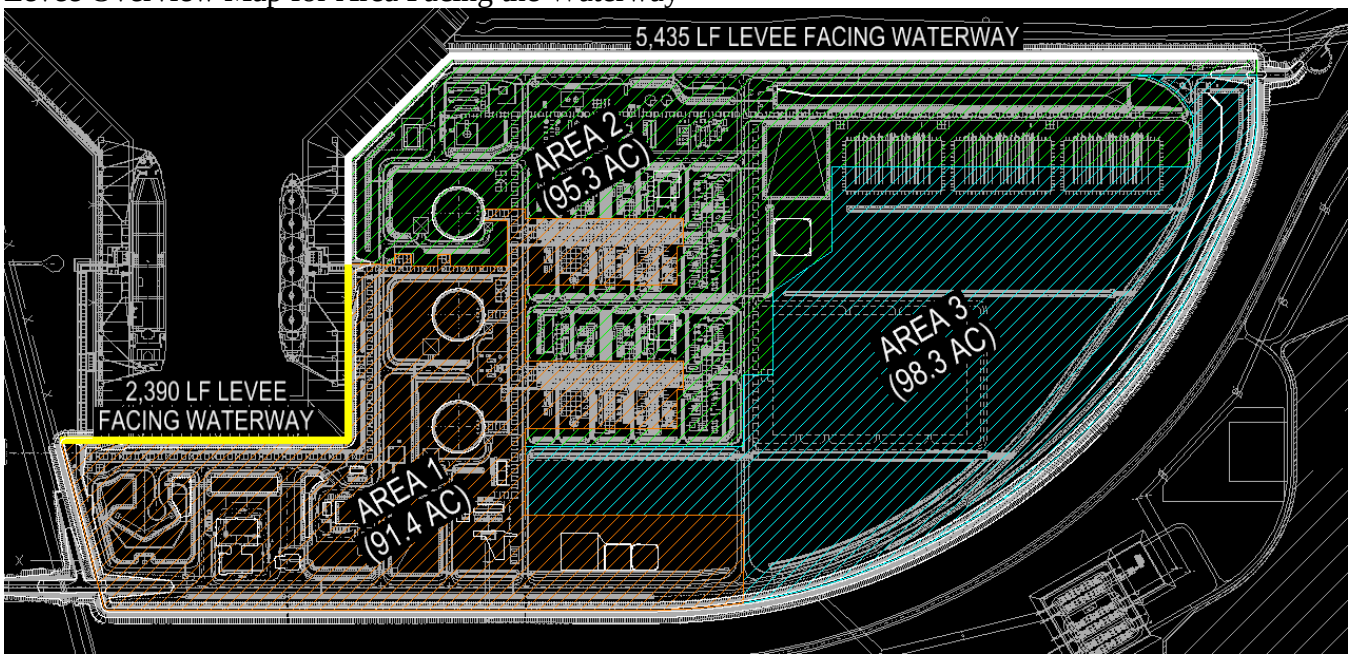
Determine the volume for overtopping for each area **facing the waterway** with a rate overtopping rate of 0.10 cfs per foot length of levee, for a maximum period of 2-hours:

Area 1- Berm Length facing waterway = 2,390 ft
Volume = 2,390 ft * 0.1 ft^3 / sec / ft * 2 hr * 3600 sec / hr = 1,720,800 cf

Area 2- Berm Length facing waterway = 5,435 ft
Volume = 5,435 ft * 0.1 ft^3 / sec / ft * 2 hr * 3600 sec / hr = 3,913,200 cf

Area 3- No volume from overtopping, not facing waterway

Levee Overview Map for Area Facing the Waterway



Determine the volume for overtopping for each area **on the landside** with a rate overtopping rate of 0.10 cfs per foot length of levee, for a maximum period of 2-hours:

Area 1- Berm Length facing waterway = 4,190 ft

Volume = 4,190 ft * 0.1 ft^3 / sec / ft * 2 hr * 3600 sec / hr = 3,016,800 cf.

Area 2- no volume from overtopping, not on the landside

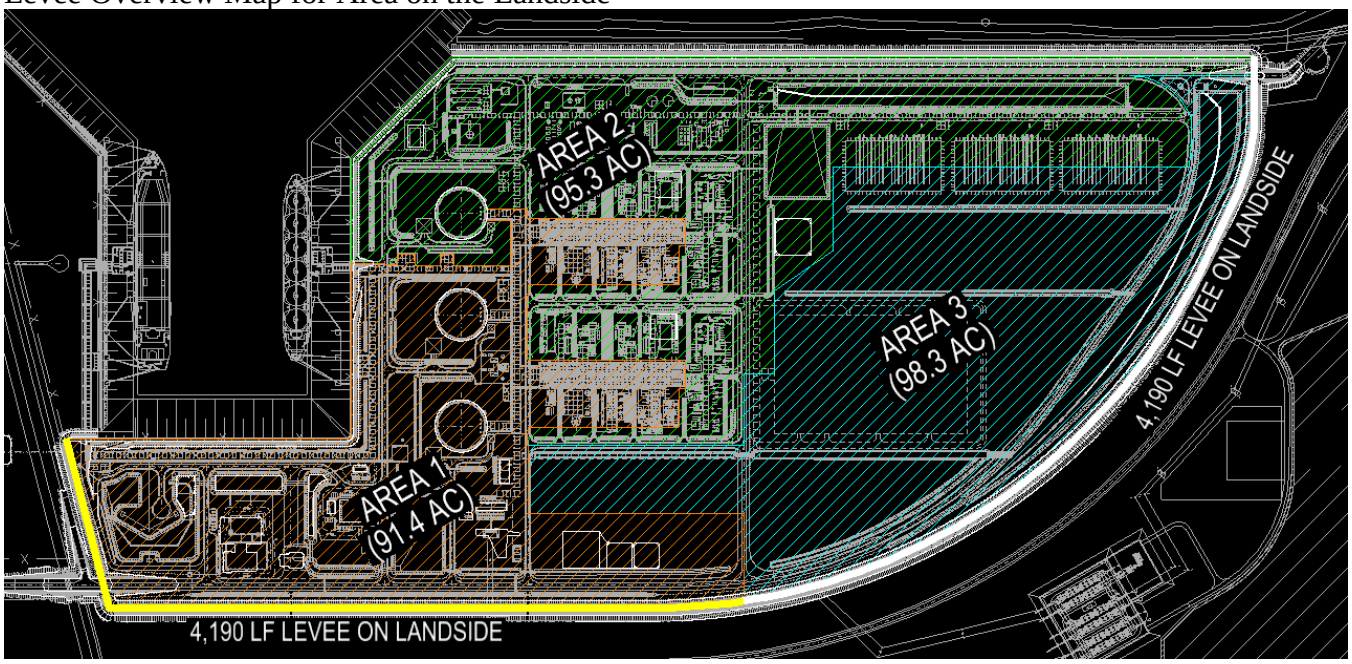
Area 3- Berm Length facing landside = 4,190 ft

Volume = 4,190 ft * 0.1 ft^3 / sec / ft * 2 hr * 3600 sec / hr = 3,016,800 cf.

Total Overtopping volume = 6,033,600 cf.

Use volume from the landside.

Levee Overview Map for Area on the Landside



Total volume (depth) = 26,968,649 + 6,033,600 =33,002,249 cf (elev 8.74')

The Critical Equipment Point of Support elevation should be set at 9.00' minimum.

NOTES:

1. FOR GENERAL NOTES AND REFERENCE SEE DRAWING 26196-100-C0-000-00005 (PAL-PJT-CIV-DWG-00-X-0005).
2. ALL DIMENSIONS AND COORDINATES ARE IN FEET UNLESS NOTED OTHERWISE.
3. SOIL IMPROVEMENT SHALL BE PERFORMED FROM STRIPPED SURFACE ON LOW GROUND AND FROM ROUGH GRADE DRAWING FEATURES ON HIGH GROUND.
4. FOR ROUGH GRADING DRAWINGS SEE 26196-100-CG-000-00100 (PAL-PJT-CIV-DWG-00-X-8100) AND 26196-100-CG-000-00250 (PAL-PJT-CIV-DWG-00-X-8250).
5. FOR CLEARING, GRUBBING AND STRIPPING DRAWING SEE 26196-100-CG-000-00011 (PAL-PJT-CIV-DWG-00-X-8011).
6. ALL MATERIALS, SITE PREPARATION AND EARTHWORKS SHALL ADHERE TO PROJECT SPECIFICATION FOR SITE PREPARATION AND EARTHWORKS, 26196-100-3PS-CG00-00001 (PAL-PJT-CIV-STD-00-X-0001).
7. WORK SHALL NOT DISTURB EXISTING UNDERGROUND PIPELINES AND UTILITIES. IF AN UNKNOWN PIPELINE OR UTILITY IS ENCOUNTERED, STOP WORK IMMEDIATELY AND NOTIFY THE RESIDENT ENGINEER FOR FURTHER DIRECTION.
8. ALL SOIL IMPROVEMENT WORK SHALL ADHERE TO PROJECT SPECIFICATION FOR SOIL IMPROVEMENT, 26196-100-3PS-CY05-00002 (PAL-PJT-CSA-STD-00-GEN-0002).
9. SHALLOW SOIL IMPROVEMENT CEMENT DOSAGE SHALL BE 6% OF THE WET WEIGHT OF 100 POUNDS PER CUBIC FOOT AT ALL AREAS WHERE FINISH GRADE ELEVATION WILL BE GREATER THAN 1 FOOT ABOVE EXISTING GRADE, AND 5.2% OF THE WET WEIGHT OF 100 POUNDS PER CUBIC FOOT AT ALL AREAS WHERE FINISH GRADE ELEVATION WILL BE EQUAL TO OR LESS THAN 1 FOOT ABOVE EXISTING GRADE. LIME DOSAGE SHALL BE 2% OF THE WET WEIGHT OF 100 POUNDS PER CUBIC FOOT. LIME USED SHALL BE QUICK LIME (PELLETIZED). WATER TO CEMENT RATIO SHALL BE 0.75.
10. FOR SHALLOW SOIL IMPROVEMENT DETAILS SEE DRAWINGS 26196-100-CG-000-00223 (PAL-PJT-CIV-DWG-00-X-8223), 26196-100-CG-000-00224 (PAL-PJT-CIV-DWG-00-X-8224) AND 26196-100-CG-000-00230 (PAL-PJT-CIV-DWG-00-X-8230).
11. DEEP MIXING METHOD (DMM) CEMENT DOSAGE SHALL BE 421 POUNDS PER CUBIC YARD. WATER TO CEMENT RATIO SHALL BE 0.80. CEMENT DOSAGE AND WATER TO CEMENT RATIO SHALL BE CONFIRMED BY PRE-PRODUCTION TEST.
12. FOR DEEP MIXING METHOD DETAILS SEE DRAWING 26196-100-CG-000-00221 (PAL-PJT-CIV-DWG-00-X-8221).
13. ALL DEEP MIXING WORK SHALL ADHERE TO PROJECT SPECIFICATION FOR DEEP MIXING METHOD 26196-100-3PS-CY05-00001 (PAL-PJT-CSA-STD-00-GEN-0001).
14. FOR SHALLOW SOIL IMPROVEMENT DETAILS AT THE LEVEE SEE DRAWINGS 26196-100-CG-000-00225 (PAL-PJT-CIV-DWG-00-X-8225 THROUGH 26196-100-CG-000-00228 (PAL-PJT-CIV-DWG-00-X-8228).
15. FOR WICK DRAIN SPACING DETAILS SEE DRAWING 26196-100-CG-000-00229 (PAL-PJT-CIV-DWG-00-X-8229). WICK DRAIN MATERIALS SHALL ADHERE TO PROJECT SPECIFICATION FOR WICK DRAINS, 26196-100-3PS-CY05-00003 (PAL-PJT-CSA-STD-00-GEN-0003).
16. FOR SHEET PILE DETAILS SEE STRUCTURAL DETAIL DRAWING 26196-100-CP-000-00008 (PAL-PJT-CIV-DWG-00-X-8008) (LATER).
17. NO FILL SHALL BE PLACED BEFORE SOIL IMPROVEMENT IS COMPLETED AND DESIRED SOIL STRENGTH HAS BEEN ACHIEVED. GEOTECHNICAL ENGINEER SHALL INDICATE WHEN THE PLACEMENT OF FILL MAY COMMENCE.
18. CONTROLLED LOW STRENGTH MATERIAL (CLSM) OR (FLOW FILL) MAY BE USED AS A REPLACEMENT FOR SHALLOW SOIL MIXING. IN CASES WHERE SHALLOW SOIL MIXING IS NOT POSSIBLE OR PRACTICAL, THE AREA MAY BE OVER-EXCAVATED BY A MINIMUM OF 3' 6", AND BACK FILLED WITH 3' OF FLOW FILL AND 6"OF BEDDING MATERIAL BEFORE PIPE PLACEMENT.

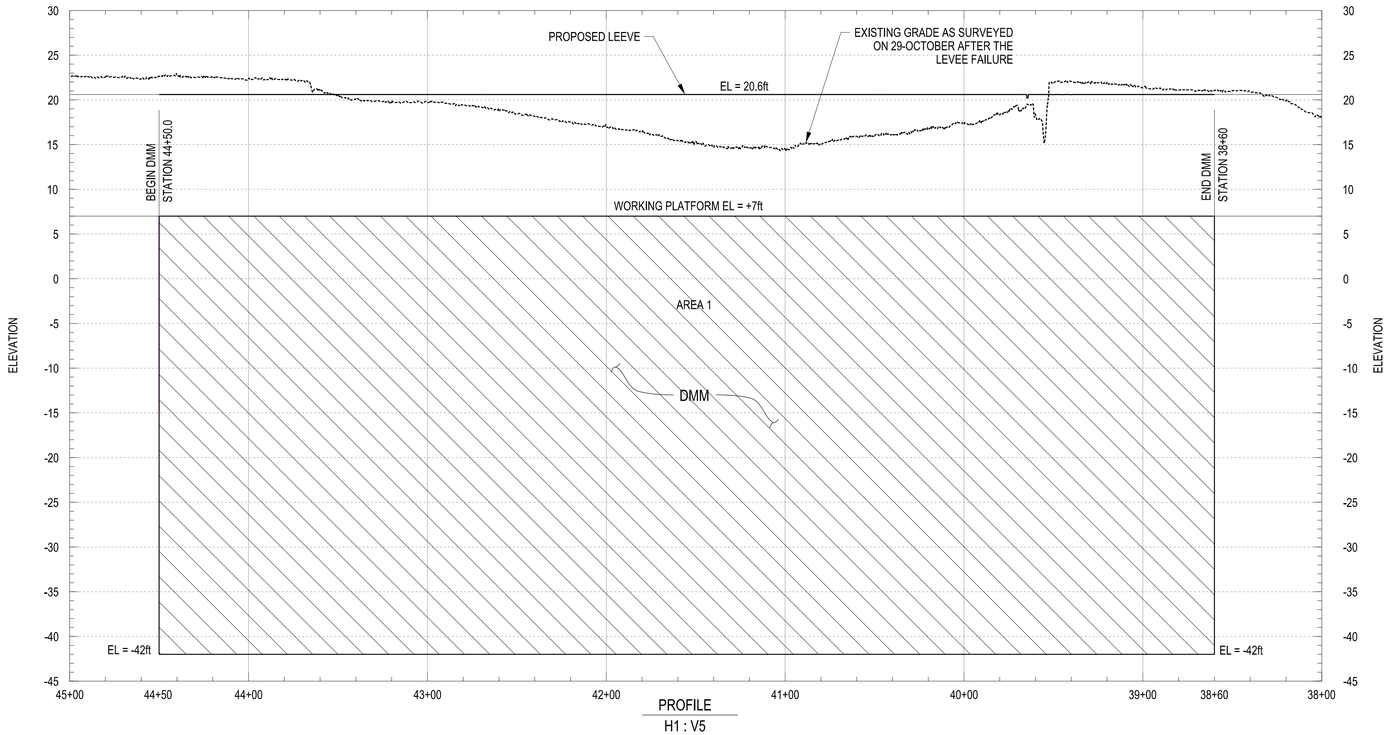
PLAN



PROFILE
H1 : V5

NOTES:

1. THE MINIMUM UNCONFINED COMPRESSIVE STRENGTH FOR THE DMM ELEMENTS SHALL BE 150 PSI AFTER 90 DAYS.
2. REFER TO THE LATEST VERSION OF PROJECT SPECIFICATION FOR DEEP MIXING METHOD (26196-100-3PS-CY05-00001) FOR FURTHER INFORMATION AND ACCEPTANCE TESTING REQUIREMENTS.
3. ALL CORE HOLES FROM PRODUCTION TESTING SHALL BE BACKFILLED WITH FLOWABLE FILL OR EQUIVALENT PRODUCT OF MIN COMPRESSIVE STRENGTH 150 PSI, USING THE TREMIE METHOD.
4. SUBCONTRACTOR SHALL SUBMIT TO CONTRACTOR DETAILS OF EQUIPMENT, MATERIALS, MEANS, METHODS AND PROCEDURES TO INSTALL THE DMM AS REQUIRED BY THE LATEST VERSION OF THE PROJECT SPECIFICATION FOR DEEP MIXING METHOD (26196-100-3PS-CY05-00001).
5. DMM TAKE OFF ESTIMATED AT 85,334 CY.
6. HORIZONTAL CONTROL IS IN PLANT COORDINATES AND ELEVATIONS IN NAVD 88.
7. EMBANKMENT FILL CONSTRUCTED ON DMM DOES NOT REQUIRE ANY COMPENSATION FILL.
8. LEVEE FILL RATE IS RESTRICTED TO 1 FT OF ELEVATION GAIN PER DAY.
9. TWO INCLINOMETERS SHALL BE INSTALLED AT THE EMBANKMENT NORTHERN TOE, ONE AT STA. 40+00 AT LEVEE TOE AND ANOTHER AT STA 43+00 AT RAMP TOE, TIPPED AT ELEVATION -100 FT. IN ADDITION, FOUR SETTLEMENT PLATES SHALL BE INSTALLED AT STATION NUMBERS 39+00, 40+00, 43+00 AND 44+00, AT THE TOP OF DMM AND AT THE MIDDLE OF THE LEVEE CREST. INSTRUMENTATION SHALL BE INSTALLED AS SOON AS DMM IN THE RESPECTIVE AREAS IS COMPLETE AND PRIOR TO ANY EMBANKMENT CONSTRUCTION COMMENCES. READINGS SHALL BE OBTAINED DAILY DURING FILL PLACEMENT AND FOR 2 WEEKS AFTER REACHING FINAL ELEVATION AND BIWEEKLY THEREAFTER UNTIL STABILIZATION OF SETTLEMENTS IS ACHIEVED AS DIRECTED BY THE FIELD GEOTECHNICAL ENGINEER.

PLAN

PROFILE
H1 : V5

NOTES:

1. THE MINIMUM UNCONFINED COMPRESSIVE STRENGTH FOR THE DMM ELEMENTS SHALL BE 150 PSI AFTER 90 DAYS.
2. REFER TO THE LATEST VERSION OF PROJECT SPECIFICATION FOR DEEP MIXING METHOD (26196-100-3PS-CY05-00001) FOR FURTHER INFORMATION AND ACCEPTANCE TESTING REQUIREMENTS.
3. ALL CORE HOLES FROM PRODUCTION TESTING SHALL BE BACKFILLED WITH FLOWABLE FILL OR EQUIVALENT PRODUCT OF MIN COMPRESSIVE STRENGTH 150 PSI, USING THE TREMIE METHOD.
4. SUBCONTRACTOR SHALL SUBMIT TO CONTRACTOR DETAILS OF EQUIPMENT, MATERIALS, MEANS, METHODS AND PROCEDURES TO INSTALL THE DMM AS REQUIRED BY THE LATEST VERSION OF THE PROJECT SPECIFICATION FOR DEEP MIXING METHOD (26196-100-3PS-CY05-00001).
5. DMM TAKE OFF ESTIMATED AT 20,245 CY.
6. HORIZONTAL CONTROL IS IN PLANT COORDINATES AND ELEVATIONS IN NAVD 88.
7. EMBANKMENT FILL CONSTRUCTED ON DMM DOES NOT REQUIRE ANY COMPENSATION FILL.
8. LEVEE FILL RATE IS THE IS RESTRICTED TO 1 FT OF ELEVATION GAIN PER DAY IN THE DMM IMPROVEMENT AREA.
9. THREE INCLINOMETERS, SIX SETTLEMENT PLATES, AND TWO MULTI-LEVEL VIBRATING-WIRE PIEZOMETERS (VWP) SHALL BE INSTALLED AFTER GROUND IMPROVEMENT AND BEFORE LEVEE CONSTRUCTION AT STATION NUMBERS SHOWN IN TABLE. INCLINOMETERS SHALL BE INSTALLED AT THE EMBANKMENT INSIDE TOE AND TIPPED AT ELEVATION -100 FT. SETTLEMENT PLATES SHALL BE INSTALLED AT LEVEE CENTERLINE ON TOP OF GROUND IMPROVEMENT. MULTI-LEVEL VWP SHALL ALSO BE INSTALLED AT LEVEE CENTERLINE WITH SENSORS AT ELEVATIONS -20, -40, AND -80 FT. READINGS SHALL BE TAKEN DAILY DURING FILL PLACEMENT AND FOR 2 WEEKS AFTER REACHING FINAL ELEVATION AND BIWEEKLY THEREAFTER UNTIL STABILIZATION OF SETTLEMENTS AS DETERMINED BY THE FIELD GEOTECHNICAL ENGINEER.

STATION NUMBER	INSTRUMENT TYPE
110+00	SETTLEMENT PLATE AND VWP
110+50	INCLINOMETER

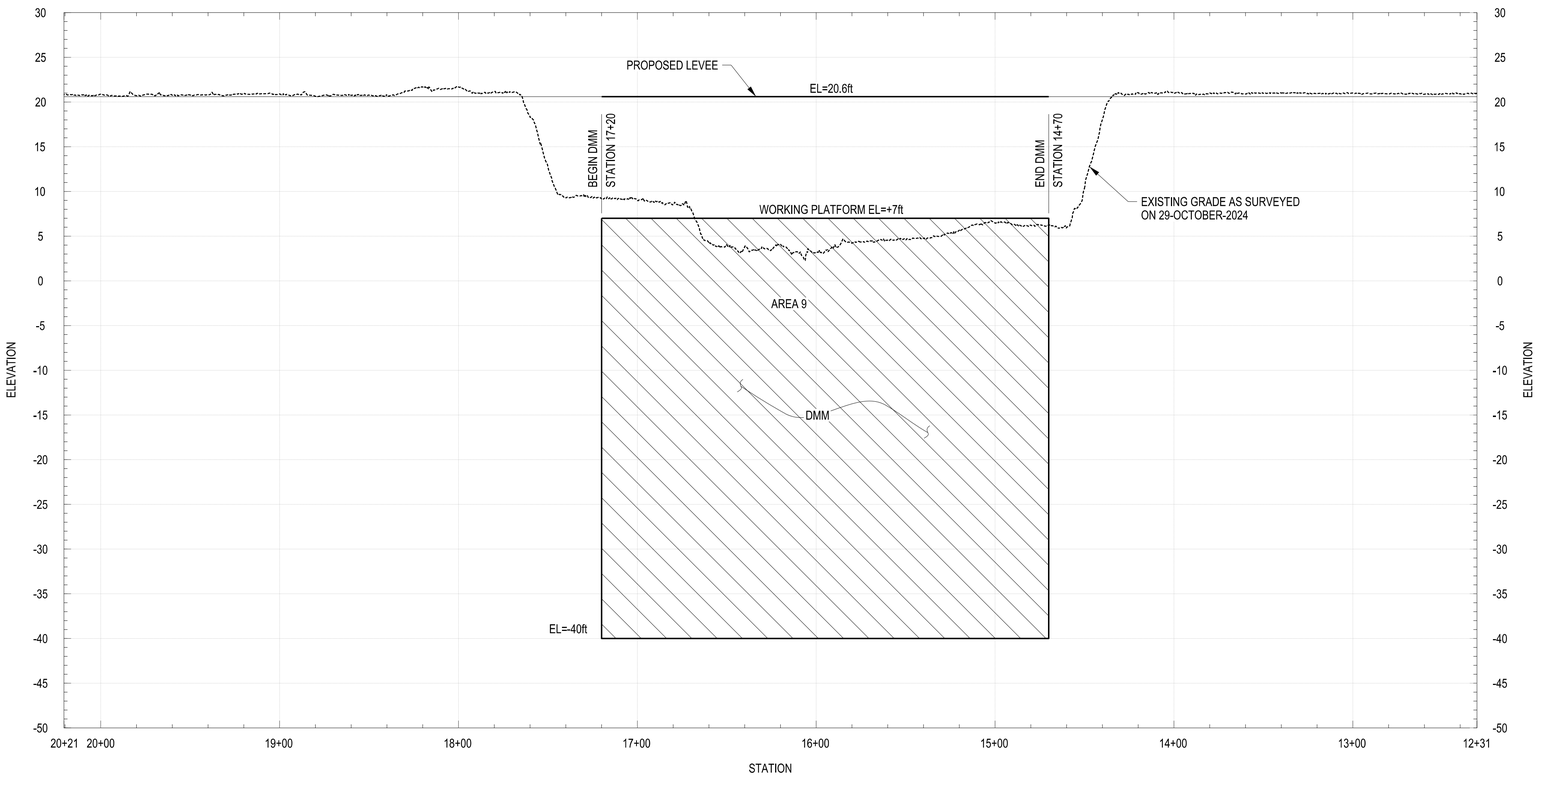
PLAN



PROFILE

H1 : V5

NOTES:

1. THE MINIMUM UNCONFINED COMPRESSIVE STRENGTH FOR THE DMM ELEMENTS SHALL BE 150 PSI AFTER 90 DAYS.
2. REFER TO THE LATEST VERSION OF PROJECT SPECIFICATION FOR DEEP MIXING METHOD (26196-100-3PS-CY05-00001) FOR FURTHER INFORMATION AND ACCEPTANCE TESTING REQUIREMENTS.
3. ALL CORE HOLES FROM PRODUCTION TESTING SHALL BE BACKFILLED WITH FLOWABLE FILL OR EQUIVALENT PRODUCT OF MIN COMPRESSIVE STRENGTH 150 PSI, USING THE TREMIE METHOD.
4. SUBCONTRACTOR SHALL SUBMIT TO CONTRACTOR DETAILS OF EQUIPMENT, MATERIALS, MEANS, METHODS AND PROCEDURES TO INSTALL THE DMM AS REQUIRED BY THE LATEST VERSION OF THE PROJECT SPECIFICATION FOR DEEP MIXING METHOD (26196-100-3PS-CY05-00001).
5. DMM TAKE OFF ESTIMATED AT 15,870 CY.
6. HORIZONTAL CONTROL IS IN PLANT COORDINATES AND ELEVATION IN NAVD 88.
7. EMBANKMENT FILL CONSTRUCTED ON DMM DOES NOT REQUIRE ANY COMPENSATION FILL.
8. LEVEE FILL RATE IS RESTRICTED TO 1FT OF ELEVATION GAIN PER DAY.
9. TWO INCLINOMETERS SHALL BE INSTALLED AT THE EMBANKMENT NORTHERN TOE, ONE AT STA 15+00 AND ANOTHER AT STA 17+00, TIPPED AT ELEVATION -100'-0". IN ADDITION, TWO SETTLEMENT PLATES SHALL BE INSTALLED AT THE SAME STATIONS, AT THE TOP OF DMM AND AT THE MIDDLE OF THE LEVEE CREST. INSTRUMENTATION SHALL BE INSTALLED AS SOON AS DMM IN THE RESPECTIVE AREAS IS COMPLETED AND PRIOR TO ANY EMBANKMENT CONSTRUCTION COMMENCES. READINGS SHALL BE OBTAINED DAILY DURING FILL PLACEMENT AND FOR 2 WEEKS AFTER REACHING FINAL ELEVATION AND BIWEEKLY THEREAFTER UNTIL STABILIZATION OF SETTLEMENTS IS ACHIEVED AS DIRECTED BY THE FILED GEOTECHNICAL ENGINEER.

NOTES

1. FOR GENERAL NOTES AND REFERENCES, SEE DRAWING 26196-100-C0-000-00005 (PAL-PJT-CIV-DWG-00-X-0005).
2. ALL DIMENSIONS, ELEVATIONS AND COORDINATES ARE IN FEET, UNLESS NOTED OTHERWISE.
3. FOR LEVEE SOIL IMPROVEMENT AND LEVEE CONSTRUCTION SEQUENCE, SEE DRAWINGS 26196-100-CG-000-00200 (PAL-PJT-CIV-DWG-00-X-8200) THROUGH 26196-100-CG-000-00229 (PAL-PJT-CIV-DWG-00-X-8229).
4. FOR HEAVY HAUL ROAD PLANS AND PROFILES, SEE DRAWINGS 26196-100-CG-000-00550 (PAL-PJT-CIV-DWG-00-X-1550) THROUGH 26196-100-CG-000-00564 (PAL-PJT-CIV-DWG-00-X-1564).
5. ALL LEVEE MATERIALS AND LEVEE CONSTRUCTION SHALL ADHERE TO PROJECT SPECIFICATION FOR SITE PREPARATION AND EARTHWORKS, 26196-100-3PS-CG00-00001 (PAL-PJT-CIV-STD-00-X-0001).
6. WORK SHALL NOT DISTURB EXISTING UNDERGROUND PIPELINES AND UTILITIES. IF AN UNKNOWN PIPELINE OR UTILITY IS ENCOUNTERED, STOP WORK IMMEDIATELY AND NOTIFY THE RESIDENT ENGINEER FOR FURTHER DIRECTION.
7. FOR SHEET PILE LOCATION, SEE SOIL IMPROVEMENT DRAWINGS 26196-100-CG-000-00200 (PAL-PJT-CIV-DWG-00-X-8200) THROUGH 26196-100-CG-000-00229 (PAL-PJT-CIV-DWG-00-X-8229).
8. FOR MARINE SHEET PILE, SEE DRAWING 26196-100-R0-100A2-00301 (PAL-T0-MAR-PLN-24-GEN-0301).
9. FOR TURF REINFORCED MAT SLOPE PROTECTION DETAILS, SEE DRAWING 26196-100-C0-000-00031 (PAL-PJT-CIV-DWG-00-X-8031).
10. SECURITY FENCING AND PATROL ROAD ON TOP OF THE LEVEE SHALL BE COMPLETED AFTER ALL SHORT-TERM SETTLEMENT FOR THE LEVEE HAS TAKEN PLACE, AS DETERMINED BY THE PROJECT GEOTECHNICAL ENGINEER.
11. FOR LEVEE SEGMENT TYPE TYPICAL SECTIONS, SEE DRAWINGS 26196-100-CG-000-00650 (PAL-PJT-CIV-DWG-00-X-7650) AND 26196-100-CG-000-00651 (PAL-PJT-CIV-DWG-00-X-7651).
12. FOR ARMOUR ROCK SHORE PROTECTION, REFER TO MARINE DRAWINGS.
13. FOR RIPRAP APRON DETAIL AT OUTFALLS, SEE DRAWING 26196-100-C0-000-00030 (PAL-PJT-CIV-DWG-00-X-8030).
14. FOUNDATION LOCATIONS ON THE LEVEE PLANS ARE APPROXIMATE AND FOR REFERENCE ONLY, NOT FOR CONSTRUCTION.
15. FOR FLEXIBLE PAVEMENT ROAD TYPICAL SECTIONS, SEE DRAWING 26196-100-C0-000-00010 (PAL-PJT-CIV-DWG-00-X-1010).
16. FOR SECURITY FENCE POST CONCRETE FOOTING DETAILS, SEE DRAWING 26196-100-C0-000-00061 (PAL-PJT-CIV-DWG-00-X-8061).
17. NO PERMANENT FILL SHALL BE PLACED BEFORE SOIL IMPROVEMENT IS COMPLETED AND DESIRED SOIL STRENGTH HAS BEEN ACHIEVED. GEOTECHNICAL ENGINEER APPROVAL SHALL BE OBTAINED PRIOR TO LEVEE FILL PLACEMENT.
18. LOW PERMEABILITY FILL SHALL BE COMPACTED TO AT LEAST 92% MODIFIED MAXIMUM DRY DENSITY PER ASTM D 1557.

002

1.0 DESIGN BASIS

1.1 Purpose and Scope

The purpose of this Shore Protection calculation report is to present the design calculations on the shore protection at the dredging slope for the proposed LNG basin and LNG plant's shoreline of the Port Arthur Liquefaction Project. This also includes the shore protection for the Storm Water Drainage that is located within the LNG Berth Area. The Shore Protection is designed to withstand wind generated storm waves, passing vessel generated wakes, and propeller wash from tugboats. This calculation report will carry out the detailed design of shore protection of the Port Arthur Liquefaction Project.

1.2 Shore Protection Design Description

At the berthing pocket of the LNG terminal, the existing land will be excavated and dredged to accommodate the design LNG vessels while the existing shoreline in the property of the Project will be excavated accordingly to form a new slope on which the shore protection will be installed. The levee and shoreline protection proposed in the Project are shown in Figure 1:

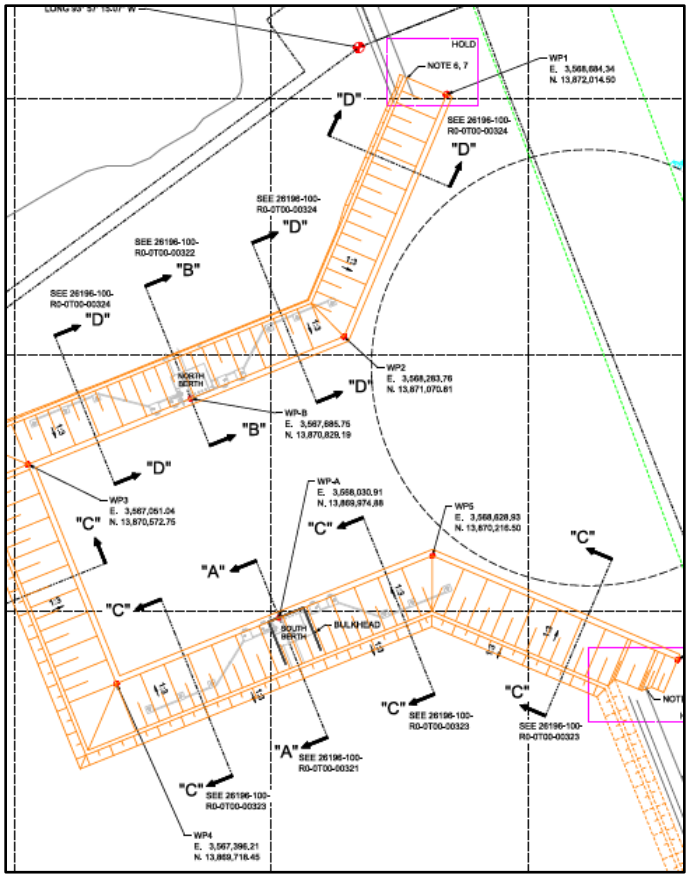

Figure 1 Plan of Shore Protection

The slope stability at LNG basin and shoreline has been checked by Geotechnical analysis. Slope stability analysis indicates the proposed 3H:1V slope will be stable with the addition of sheet piling to provide the required factor of safety. Refer to 26196-100-3DR-K04F-00003 (PAL-PJT-CSA-RPT-00-GEN-0003), EPC Geotechnical Design Basis Report and 26196-100-CMC-000-00010 (PAL-T0-MAR-CAL-82-GEN-0010) Shore Protection Sheet Pile Structural Strength Calculation.

3.0 DESIGN METHODOLOGY

3.1 Revetment Design on 100- and 500-year Storm Wave

For the riprap revetments, the stability of the protection layer primarily depends on the specified rock size being able to resist the wave action. In this calculation, the design storm wave is the **100-year** storm wave at PALNG basin and property shoreline while **500-year** storm wave is for levee which surround the LNG Plant.

The excel spreadsheet developed per Reference 2.2.4 "Rock Manual" (CIRIA, 2007), was used for this slope protection revetment design. This application provides estimates for revetment amour and bedding layer stone sizes, thicknesses, and gradation characteristics.

3.2 Revetment Design on Wake of Passing Vessels

Per Principles for the Design of Bank and Bottom Protection for Inland Waterways (GBB), BAW Code of Practice (reference 2.2.2), the primary wave (transverse stern wave), secondary wave, return and slope supply flow due to the passing vessel are calculated for revetment design. The result on required rock size is determined by the Figure 3-1 below.

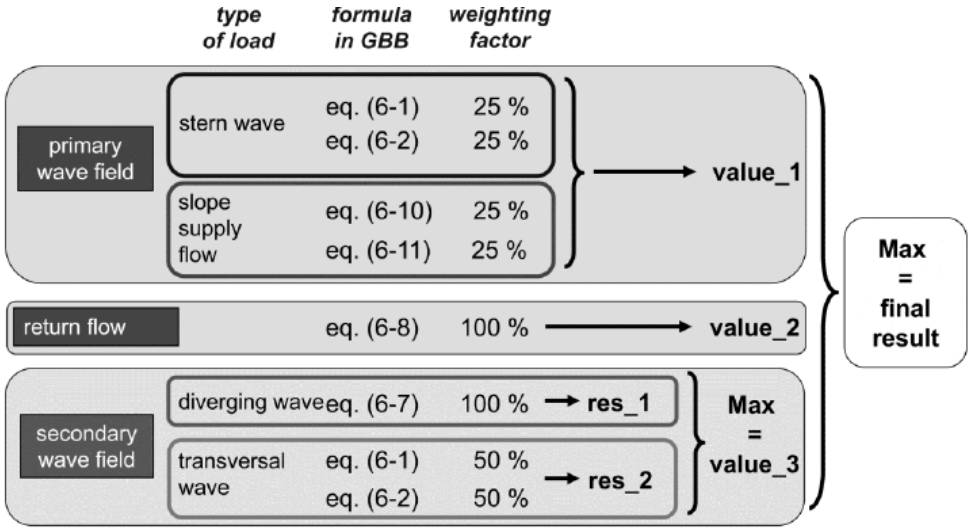

Figure 3-1. BAW Code for Required Armor Stone Size

3.3 Revetment Design on Propeller Wash

The method used for this design was taken from the Rock Manual (CIRIA, 2007), which uses the following equations to estimate the time-averaged current velocities in these propeller jets.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

Initial velocity behind propeller:

$$u_{p,0} = 1.15\left(\frac{P}{\rho_w {D_0}^2}\right)^{1/3}$$

Velocity along jet axis:

$$u_{p,axis}(x) = a\, u_{p,0}\left(\frac{D_0}{x}\right)^m$$

$$u_p(x,r) = u_{p,axis}(x) exp\left[\frac{-br^2}{x^2}\right]$$

Velocity distribution along slope.

Maximum bed velocity;

$$u_{p,\max bed} = c\, u_{p,0}\left(\frac{D_0}{z_p}\right)^n$$

where:

P = applied power

D_p = propeller diameter

D_0 = effective diameter of propeller (= $0.7D_p$ or $1.0D_p$)

zp = distance between propeller axis and bed

ρ_w = Water density

a, b, c, m, n = empirical coefficients for describing jet turbulence

Given the flow velocities calculated from the above equations, by using the Izbash approach (presented in the Rock Manual), the following method is used to determine the rock stability.

$$\frac{\left(\frac{u_p(x,r)^2}{2g}\right)}{\Delta D_{50}} = 2\frac{k_{sl}}{{k_t}^2}$$

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

where;

$u_p(x,r)$ = propeller jet velocity along slope
Δ = relative density
D_{50} = median stone diameter
g = gravity
k_t = Empirical turbulence factor

$$k_{sl} = \text{slope factor} = \cos\alpha \sqrt{1 - \left(\frac{\cos\alpha}{\tan\emptyset}\right)^2}$$

α = slope angle
ϕ = protection material angle of repose

4.0 DESIGN INPUTS

4.1 Water Level

Reference 2.1.6 provides the water levels at various storm events and Relative Sea Level Rise (RSLR) as represented in Table 1.

Table 1 Water Level at Varied Storm Event [Ref. 2.1.1]

Return Period	SWEL + RSLR (ft, NAVD88)
100-year	10.2 + 0.6
500-year	14.0 + 0.6

4.2 Design Conditions

The conditions considered in the Shore Protection design are as following:

- 100- and 500-year Storm Wave
- Passing Vessel in Port Arthur Channel
- Propeller Wash in LNG berthing and turning basin.

4.3 Design Condition Details

4.3.1 Shoreline Protection Design at 100-year Storm Wave

Provided by both reference 2.1.5 and 2.1.6, the wave parameters at the location of LNG basin were represented in Table 2. The average 4.4ft wave height was adopt in this shore protection design.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.

Table 2 Design Wave at 100-year Storm

Data Source	At shoreline - wave height Hs and period Tp	In LNG basin* - wave height Hs and period Tp
From Shoreline Protection, Reference 2.1.5	4.0 ft and 3.3 seconds	2.2 ft and 3.3 seconds
From Metocean Report, Reference 2.1.6	4.8 ft and 3.8 seconds	2.6 ft and 3.8 seconds
Adopted Wave in this Shoreline Protection Design	4.4 ft and 3.8 seconds**	2.5 ft and 3.8 seconds

*Note: a diffraction coefficient of 0.55 was applied in dredged LNG basin per CEM
** Average wave height between identified sources

In this shore protection design, the adopted inputs for riprap revetment design are:

- Wave Hs = 4.4 ft and T_p = 3.8 seconds at all property shoreline.
- Wave Hs = 2.5 ft and T_p = 3.8 seconds in LNG basin.

4.3.2 Shoreline Protection Design at 500-year Storm Wave

Provided by the reference 2.1.5, the wave parameters at the location of LNG basin were represented in Table 3.

Table 3 Design Wave at 500-year Storm

Data Source	At shoreline - wave height Hs and period Tp	In LNG basin* - wave height Hs and period Tp
From Shoreline Protection, Reference 2.1.5	5.9 ft and 4.0 seconds	3.3 ft and 4.0 seconds
Adopted Wave in this Shoreline Protection Design	5.9 ft and 4.0 seconds	3.3 ft and 4 seconds

In this shore protection design, the adopted inputs for riprap revetment design are:

- Wave Hs = 5.9 ft and T_p = 4.0 seconds at all property shoreline.
- Wave Hs = 3.3 ft and T_p = 4.0 seconds in LNG basin.

4.3.3 Passing Vessel in Port Arthur Canal

Reference 2.1.6 stated that “vessel passing by Port Arthur LNG are expected to travel at speeds between 6 and 7 knots”. In this shoreline protection design, for a conservative maximum as did in Reference 2.1.6, the passing vessel’s speed with 10 knots were adopted. The particulars of the passing vessel and associated parameters are listed in the following Table 4Table 4.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.

Table 4 Passing Ship Particulars

Passing Crude Oil Tanker	Characteristics
Length Overall (ft)	810
Breadth (ft)	137
Draft, loaded (ft)	40
Passing speed (knots)	10
Distance from Shoreline to CL of channel (ft)	550
Design travel speed (knot)	10

4.3.4 Propeller Wash

The PALNG Navigation Simulation provided by Client, the 4 assistant tugs with 80 mt bollard pull capacity were applied during maneuvering within turning basin and LNG basin. Thus, the Robert Allen RA 3200 tug was selected in this LNG berthing and turning basin propeller wash calculation. The assistant tugboat's particulars and associated parameters are listed in the following Table 5.

Due to the arrangement on using 4 tugs to assist the arrival and departure of the LNG vessels in the LNG terminal, the propeller wash from LNG vessel's main propulsion and thruster are not included in this calculation – LNG vessel's main propulsion and thruster are assumed to not be used in the basins.

Table 5 Design Tug Particulars

Tug – Robert Allen RAstar 3200	Characteristics
Length Overall (ft)	105 (32m)
Breadth (ft)	42 (12.8m)
Draft, loaded (ft)	19 (5.8m)
Depth (ft)	17.6 (5.37m)
Propeller Diameter (ft)	8.9 (2.7m)
Engine Power (watt) – Twin	2 x 2,240,000
Bollard Pull (mt)	80

Reference 2.1.9 stated that "pilots generally used the least tug power possible to safely complete the simulation, …… the most simulations rarely exceeded 75% sustained tug power usage". Combined with PIANC recommendation of Reference 2.2.3, the power usages of the assistant tugboats are assumed in the Table 6.

Noted that in the basin, the assistant tug is restricted to keep a minimum clearance of 50 ft from the toe of the dredged slope (fender line).

Table 6 Tug Power Usage Regarding the Separated Distance to the Toe of Slope

Distance from Toe of the Dredged Slopes	Power Usage in Berthing Basin – PIANC &Typical	Power Usage in Berthing Basin – Reference 2.1.8
More than 100 ft (about 1.0 tug LOA)	100%	75%
50 to 100 ft (about 0.5 -1.0 tug LOA)	50%	*75%
0 to 50 ft (about < 0.5 tug LOA)	Not Allowed	-

*Noted that the 75% in Reference 2.1.8 is also assumed in this range for checking the most conservative scenario.

5.0 CALCULATIONS ON MOF REVETMENT ROCK

5.1 General

The calculated rock sizes (by weight) are summarized in Table 7, while the detailed calculations are included in the attachments.

5.2 Required Rock Sizes by 100- and 500-year Storm Waves

Following table is the summary for the required rock size for the 100- and 500-year storm wave conditions. Detailed calculations are presented in Attachment A (A1 to A4). (Note: Ts = Tp/1.1 per Random Sea and Design for Maritime Structure, Goda).

Noted that the functional requirement for installed riprap shore protection is to have minimum damage “initial damage” for 100-year storm while the requirement for installed riprap levee protection is to allow certain damage of “intermediate damage” for 500-year storm.

The permeability coefficient P was categorized between 0.1 to 0.4 per CEM – most conservative and least conservative.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.

Table 7 Required Stone Size for 100- and 500-year Storm Wave Conditions

Location	Design Storm	Storm Wave Hs and Tp	Permeability Coefficient P	Allowed Damage Coefficient S	Required Rock Size W_{50} (lb)
Property shoreline	100-year	4.4 ft 3.8 sec	0.1 to 0.4	2 for "initial"	496 to 235
	500-year	5.9 ft 4.0 sec	0.1 to 0.4	6 for "intermediate l"	**536** to 254
LNG berthing basin	100-year	2.5 ft 3.8 sec	0.1 to 0.4	2 for "initial"	139 to 66
	500-year	3.3 ft 4.0 sec	0.1 to 0.4	6 for "intermediate"	**145** to 69

5.3 Required Rock Size by Passing Vessel

The passing vessel-generated wave and flow are calculated per BAW equations and summarized in the below table. The required rock sizes (by D_{50}) for each equation are included in the last column. Note that BAW equations for passing vessel are only to produce the required rock size but not rock weight. For the consistency with Section 5.2 and 5.4, the final rock weight determined by Figure 3-1 (Figure 6-3 in Ref 2.2.2.) is calculated by cube shape – required rock size by D_{50} is 1.12 ft and rock weight by W_{50} is 230 lb.

The results are tabulated in Table 8 below, with the detailed calculations of BAW equations presented in the Attachment B.

Table 8 Required Armor Stone Size by Passing Vessel

Items by Equations	Required Size by D_{50}
Design Transversal Stern Wave (BAW Eq 6-1)	1.53 ft
Design Primary Stern Wave (BAW Eq 6-2)	0.70 ft
Secondary Wave (BAW Eq 6-7)	0.73 ft
Return Flow Velocity (BAW Eq 6-8)	0.54 ft
Slope Supply Flow (BAW Eq 6-10)	0.62 ft
Slope Supply Flow & Primary Stern Wave (BAW Eq 6-11)	0.42 ft
BAW Figure 6-3 – Weighted in Size, ft	**1.12 ft**
BAW Figure 6-3 – Weighted in Weight, lb	**230 lb**

5.4 Required Rock Size by Propeller Wash of Tugboats

Following Table 9 is the summary for the required rock sizes for Tugboats propeller wash at varied separated distance with different power levels. In the typical propeller wash scenario per PIANC, the required rock size is 225 lb. For checking purpose, the 75% power usage in Reference 2.1.8 is also assumed at the distance range of 50 to 100 ft, then the required rock size is 506lb. Detailed design calculations are presented in Attachment C.

Table 9 Required Armour Stone Size by Propeller Wash of Tugboats

Clearance from Toe of the Dredged Slopes	Required Rock Size W_{50} (lb) - Typical	Required Rock Size W_{50} (lb) by Reference 2.1.8
More than 100 ft (> 1.0 tug LOA)	145	81
50 to 100 ft (0.5 -1.0 tug LOA)	225	506
0 to 50 ft (0.5 tug LOA)	-	-

5.5 Required Revetment Rock Size and Armor Rock Thickness

Among all scenario from section 5.2, 5.3 and 5.4, the required riprap revetment is listed in the Table 10 the section at and above water surface is subject to the action of storm wave and passing ship navigated in Port Arthur Channel while the section below water surface is only subject to propeller wash from the terminal assistant tugboats in operation. This is also applicable to the storm water drainage within the LNG basis, as wave and vessel wake will control the rock sizing.

From the varied requirements in Table 10, if a single rock size was recommended to satisfy all requirements at all locations and both of above and below water surface, it will be:

- W_{50} = 550 lb by rock weight.
- 3.0 ft thickness of rock.

The calculation of rock thickness and rock gradation are presented in Attachment A (A6).

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.

Table 10 Summary of Required Armour Stone

	Location	Determined by	Required Rock Weight by W_{50} (lb)
Riprap Revetment Section at & above Waterline	at property shoreline	500-year storm – intermediate damage	536
		100-year storm – initial damage	496
		Passing ship at Port Author Channel	230
	at LNG basin	500-year storm – intermediate damage	145
		100-year storm – initial damage	139
		Passing ship in Port Author Channel	< 230*
Riprap Revetment Section below Waterline	at LNG basin	Propeller wash from tugboats – worst manoeuvring	506
		Propeller wash from tugboats – typical manoeuvring	225

*Not calculated but the wake diffracted into the LNG basin should be less than that at the property shoreline.

6.0 CONCLUSION AND RECOMMENDATION

Based on the Coastal Engineering Analysis, the following are recommended for the LNG Berth Shore Protection:

1. The coastal engineering calculations suggest that the following shore protection design summarized in Table 11 meets the design requirements including the storm wave, passing vessels and propeller wash in the LNG basin and property shoreline area.

2. By consolidating the rock sizes required at property shoreline and LNG basin, the recommended option is:

    - The required armour rock size by weight W_{50} is 550 lb
    - The required thickness of the 550 lb armour rock is 3.0 ft.
    - The required bedding stone size by weight W_{50} is 50 lb and thickness of bedding layer is 1.0 ft.

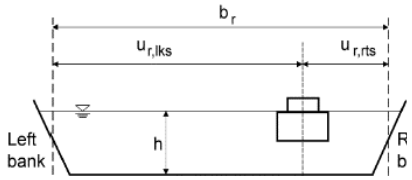
Project	Port Arthur LNG - Shorline Protection
Task	Armour Stone Size Required to Resist Load Caused By Transversal Stern Waves
Created by	Matt Liu
Checked by	
Standards	BAW Code and Practive Principles for the Design of Bank and Bottom Protection for inland Waterways

CONSTANT INPUTS			
Density of Water	ρ_W	1025	kg/m3
Gravity	g	9.81	m/s2
Bulk Density of Armour Stones	ρ_S	2650	kg/m3 N.B.:/TLW 2003/
Slope Angle	β	18	° cot (1/3)
Ship Length	L	247	m
Ship Width	B	42	m
Ship Speed	Vs	5.14	m/s
Water Depth	h	13	m
Flow Mean Vel. In Cross Section	V_{str}	0.5	m/s
Vessel CL to Bank Line	u_{rmin}	165	m, vessel offset 0.5Beam
Canal Width	b_r	390	m



EQ 6-1 & 6-2 INPUTS			
Coef. for wave generating ship	β_λ	0.9	0.72 for fast ship; 0.90 for inland navigation vessels and push-tow
Stability Coefficient	B'_B	1.5	1.5(lower limit of measured values) - 2.3(mean measured value)
Factor of Influence	C_H	1.3	1.3 (T/h=0.7, inland); 1.5 (T/h=0.4, partially laden); 1.1 sea-going vessel,large trim
Mean Drawdown near Bank	$\Delta\bar{h}_{u,Heck}$	1.40208	m, reference to 2.1.6 (p31 of MN report)
Distance Range	U'u	180	m, for Eq 5-54
Wave Height Coefficient	A_W	0.25	0.25 conventional inland vessel/tug; 0.35 empty, single-line push, 0.8 fully laden, multi-line push
Occurance Freq. Coef.	B^*_B	2	2.0 frequently occurs/damage completely avoid; 3.0 infrequently/with maintenace
Critical Ship Speed	V_{krit}	8	m/s, Eq 5-19

EQ 6-1 & 6-2 INTERMEDIATE OUTPUS			
Reduction factor	f_{red}	0.53	Eq 5-54
Slope Inclination	m	3.08	$2 \le m \le 5$
Slope Influence Coef	C_{Bo}	1.11	Eq 6-8
Coef. of Velocity	f_{cr}	1.00	[1, 1.7], Eq 5-57
Coef. Of Wave Length	f_λ	0.9	$0.9\sin[\pi(2Lw/\lambda q-0.5)]$ for $4/3Lw \le \lambda q \le 2Lw$, else 0
Max Waterkeven Drawdown	$\Delta\hat{h}_{u,Heck}$	1.822704	m, Eq 5-29 (FEED report)
Trans. Wave Length	λ_q	444.6	m, Eq 5-55
Wave Generating Ship Length	Lw	222.3	m
Primary Stern Wave Height	$H_{u,Heck}$	1.62	m, Eq 5-32
Distance Case B Design Value	$H_{u,Heck,StBem}$	1.74	m, Eq 5-53
Secondary Wave Height	$H_{sek,q}$	0.46	m, Eq 5-61&65
Design Wave Height	H_{Bem}	1.62	m
		2.67	

EQ 6-1 & 6-2 RESULTS			
Required Stone Size	**D_{50}**	**0.468**	m, Eq 6-1
Required Stone Size	**D_{50}**	**0.213**	m, Eq 6-2

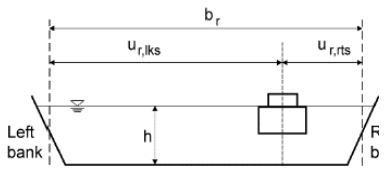
Draft	T	12	m
Ship Speed	Vs	5.14	m/s
Water Depth	h	13	m
Flow Mean Vel. In Cross Section	V_{str}	0.5	m/s
Vessel CL to Bank Line	u_{rmin}	165	m
Canal Width	b_r	390	m



EQ 6-7 & 6-8 INPUTS			
Coef. for wave generating ship	β_λ	0.9	0.72 for fast ship; 0.90 for inland navigation vessels and push-tow
Mean Drawdown near Bank	$\Delta\bar{n}_{u,Heck}$	1	m, reference to 2.1.6 (MN report)
Distance Range	U'u	180	m, for Eq 5-54
Wave Height Coefficient	A_w	0.25	0.25 conventional inland vessel/tug; 0.35 empty, single-line push, 0.8 fully laden, multi-line push
Bank Strickler Roughness	$K_{Str,u}$	30.00	m^(1/3)/s, Eq 5-38
Mean Strickler Roughness	K_{Str}	30.00	m^(1/3)/s, Eq 5-38
Boundary Layer Thickness	δv	1.00	m, Eq 5-38
Flow Velocity	V_{max}	1.81	m/s, Eq 5-39&40, Downstrean V_{ruck} -$V_{Str,Ufer}$; Upstream V_{ruck}+$V_{Str,Ufer}$
Critical Ship Speed	V_{krit}	**8**	m/s, Eq 5-19
Coef. of Velocity	f_{cr}	1.00	[1, 1.7], Eq 5-57
Coef. Of Wave Length	f_λ	0.9	0.9sin[π(2Lw/λq-0.5)] for 4/3Lw≤λq≤2Lw, else 0

EQ 6-7 & 6-8 INTERMEDIATE OUTPUS			
Reduction factor	f_{red}	0.53	Eq 5-54
Slope Inclination	m	3.08	2 ≤ m ≤ 5
Equivalent Width at Water Level	$b_{WS,aqui}$	430.01	m, Eq 5-11
Drawdown Area Mean Width	b_m	426.93	m, Eq 5-23
Return Flow Velocity	V_{ruch}	1.06	m/s, Eq 5-23
Slope Influence Coef	C_{Bo}	1.11	Eq 6-8
Isbash Coefficient	C_{isb}	0.70	Eq 6-8
Surf Similarity Parameter	ζ	8.28	Eq 6-7
Mean Flow Velocity	$V_{Str,Ufer}$	0.75	m/s, Eq 5-28
Trans. Wave Length	λ_q	444.6	m, Eq 5-55
Diverging Wave Length	λ_s	296.4	m, Eq 5-59
Wave Generating Ship Length	Lw	222.3	m
Secondary Wave Height	$H_{sek,q}$	0.46	m, Eq 5-61&65

EQ 6-7 & 6-8 RESULTS			
Required Stone Size	**D_{50}**	**0.22**	m, Eq 6-7
Required Stone Size	**D_{50}**	**0.16**	m, Eq 6-8

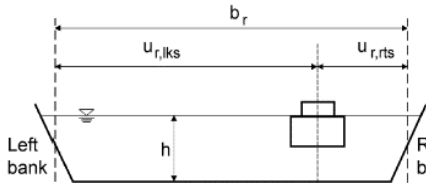
Project	Port Arthur LNG
Task	Armour Stone Size Required to Resist Load Causeddue to Slope Supply Flow
Created by	Matt Liu
Checked by	T Chris
Standards	BAW Code and Practive Principles for the Design of Bank and Bottom Protection for inland Waterways

CONSTANT INPUTS			
Density of Water	ρ_w	1025	kg/m3
Gravity	g	9.81	m/s2
Bulk Density of Armour Stones	ρ_s	2650	kg/m3 N.B.:/TLW 2003/
Slope Angle	β	18	°
Ship Length	L	247	m
Ship Width	B	42	m
Draft	T	12	m
Ship Speed	Vs	5.14	m/s
Water Depth	h	13	m
Flow Mean Vel. In Cross Section	V_{str}	0.5	m/s
Vessel CL to Bank Line	u_{rmin}	165	m
Canal Width	b_r	390	m



EQ 6-10 & 6-11 INPUTS			
Factor of Influence	C_H	1.3	1.3 (T/h=0.7, inland); 1.5 (T/h=0.4, partially laden); 1.1 sea-going vessel,large trim
Mean Drawdown near Bank	$\Delta\bar{h}_{u,Heck}$	1	m, reference to 2.1.6 (MN report)
Bank Strickler Roughness	$K_{Str,u}$	30.00	m^(1/3)/s, Eq 5-38
Mean Strickler Roughness	K_{Str}	30.00	m^(1/3)/s, Eq 5-38
Boundary Layer Thickness	δv	1.00	m, Eq 5-38

EQ 6-10 & 6-11 INTERMEDIATE OUTPUS			
Slope Inclination	m	3.08	2 ≤ m ≤ 5
Equivalent Width at Water Level	$b_{WS,aqui}$	430.01	m, Eq 5-11
Drawdown Area Mean Width	b_m	426.93	m, Eq 5-23
Slope Influence Coef	C_{Bo}	1.11	Eq 6-8
Isbash Coefficient	C_{lsb}	0.70	Eq 6-8
Max Waterkeven Drawdown	$\Delta\hat{h}_{u,Heck}$	1.3	m, Eq 5-29
Mean Flow Velocity	$V_{Str,Ufer}$	0.75	m/s, Eq 5-28
Froude Number Square	Fr^2	2.33	Eq 5-37
Max. Vel of Slope Supply Flow	Umax	1.54	m/s, Eq. 5-36
Slope Supply Flow Design Speed	$U_{max,B}$	2.29	m/s, Eq. 5-41&42, downstream Umax+VStr,Ufer, upstream Umax-VStr,Ufer
Primary Stern Wave Height	$H_{u,Heck}$	1.15	m, Eq 5-32

EQ 6-10 & 6-11 RESULTS			
Required Stone Size	**D_{50}**	**0.19**	m, Eq 6-10
Required Stone Size	**D_{50}**	**0.13**	m, Eq 6-11

The new *RAstar 3200* tug ***Eugene***, constructed by Cheoy Lee Shipyards, Hong Kong, has been delivered to its owners Kenya Ports Authority, Mombasa, Kenya. Principal particulars of this new tug are:

- Length O.A.: 32.00 m
- Beam, moulded: 12.80 m
- Depth, moulded (hull): 5.37 m
- Maximum Draft: 5.80 m

Eugene is classed and built according to the following Lloyd's Register of Shipping notation: ✠100A1, Escort Tug, ✠LMC, UMS, Fire-Fighting Ship 1 with Water Spray, Unrestricted Voyages, IWS

Main Tank Capacities are:

- Fuel Oil: 193 m³
- Fresh Water: 35 m³
- Foam: 16 m³

On trials, the ***Eugene*** met or exceeded all performance expectations, with the following results:

1.0 DESIGN BASIS

1.1 Purpose and Scope

The purpose of this Shore Protection calculation report is to present the design calculations on the shore protection at the dredging slope for the proposed LNG basin and LNG plant's shoreline of the Port Arthur Liquefaction Project. This also includes the shore protection for the Storm Water Drainage that is located within the LNG Berth Area. The Shore Protection is designed to withstand wind generated storm waves, passing vessel generated wakes, and propeller wash from tugboats. This calculation report will carry out the detailed design of shore protection of the Port Arthur Liquefaction Project.

1.2 Shore Protection Design Description

At the berthing pocket of the LNG terminal, the existing land will be excavated and dredged to accommodate the design LNG vessels while the existing shoreline in the property of the Project will be excavated accordingly to form a new slope on which the shore protection will be installed. The levee and shoreline protection proposed in the Project are shown in Figure 1:

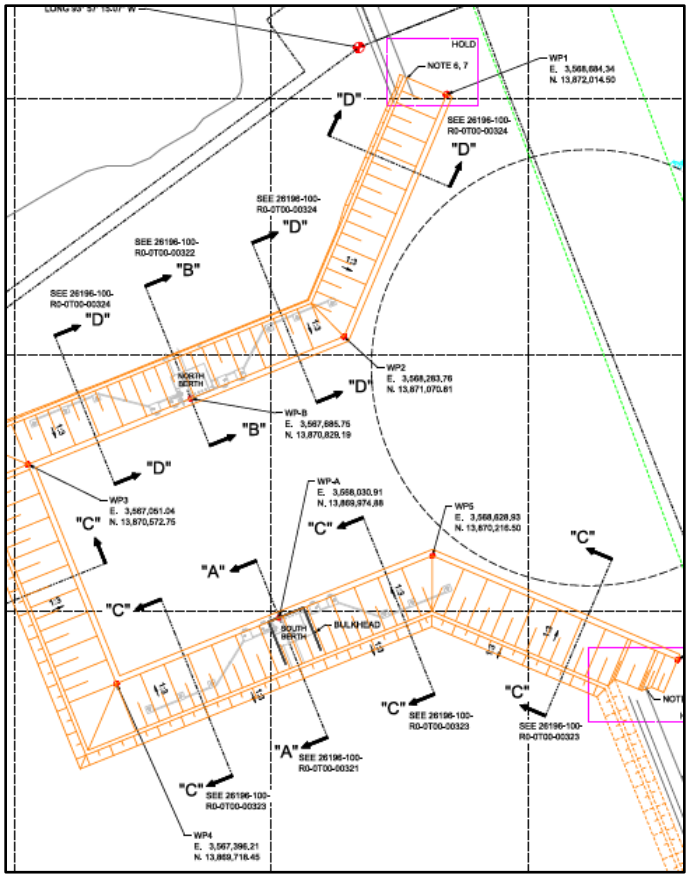

Figure 1 Plan of Shore Protection

The slope stability at LNG basin and shoreline has been checked by Geotechnical analysis. Slope stability analysis indicates the proposed 3H:1V slope will be stable with the addition of sheet piling to provide the required factor of safety. Refer to 26196-100-3DR-K04F-00003 (PAL-PJT-CSA-RPT-00-GEN-0003), EPC Geotechnical Design Basis Report and 26196-100-CMC-000-00010 (PAL-T0-MAR-CAL-82-GEN-0010) Shore Protection Sheet Pile Structural Strength Calculation.

3.0 DESIGN METHODOLOGY

3.1 Revetment Design on 100- and 500-year Storm Wave

For the riprap revetments, the stability of the protection layer primarily depends on the specified rock size being able to resist the wave action. In this calculation, the design storm wave is the **100-year** storm wave at PALNG basin and property shoreline while **500-year** storm wave is for levee which surround the LNG Plant.

The excel spreadsheet developed per Reference 2.2.4 "Rock Manual" (CIRIA, 2007), was used for this slope protection revetment design. This application provides estimates for revetment amour and bedding layer stone sizes, thicknesses, and gradation characteristics.

3.2 Revetment Design on Wake of Passing Vessels

Per Principles for the Design of Bank and Bottom Protection for Inland Waterways (GBB), BAW Code of Practice (reference 2.2.2), the primary wave (transverse stern wave), secondary wave, return and slope supply flow due to the passing vessel are calculated for revetment design. The result on required rock size is determined by the Figure 3-1 below.

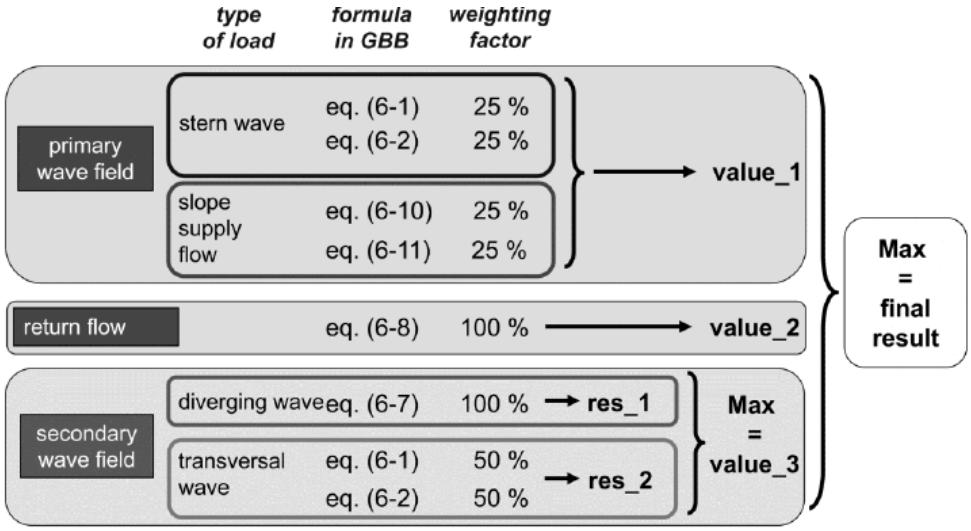

Figure 3-1. BAW Code for Required Armor Stone Size

3.3 Revetment Design on Propeller Wash

The method used for this design was taken from the Rock Manual (CIRIA, 2007), which uses the following equations to estimate the time-averaged current velocities in these propeller jets.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

Initial velocity behind propeller:

$$u_{p,0} = 1.15\left(\frac{P}{\rho_w {D_0}^2}\right)^{1/3}$$

Velocity along jet axis:

$$u_{p,axis}(x) = a\, u_{p,0}\left(\frac{D_0}{x}\right)^m$$

$$u_p(x,r) = u_{p,axis}(x) exp\left[\frac{-br^2}{x^2}\right]$$

Velocity distribution along slope.

Maximum bed velocity;

$$u_{p,\max bed} = c\, u_{p,0}\left(\frac{D_0}{z_p}\right)^n$$

where:

P = applied power

D_p = propeller diameter

D_0 = effective diameter of propeller (= $0.7D_p$ or $1.0D_p$)

zp = distance between propeller axis and bed

ρ_w = Water density

a, b, c, m, n = empirical coefficients for describing jet turbulence

Given the flow velocities calculated from the above equations, by using the Izbash approach (presented in the Rock Manual), the following method is used to determine the rock stability.

$$\frac{\left(\frac{u_p(x,r)^2}{2g}\right)}{\Delta D_{50}} = 2\frac{k_{sl}}{{k_t}^2}$$

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.
Refer to the Enterprise Content Management System for current revision.
© 2023, Bechtel Energy Inc. ("BEINC"). All rights reserved.

where;

$u_p(x,r)$ = propeller jet velocity along slope
Δ = relative density
D_{50} = median stone diameter
g = gravity
k_t = Empirical turbulence factor

$$k_{sl} = \text{slope factor} = \cos\alpha \sqrt{1 - \left(\frac{\cos\alpha}{\tan\emptyset}\right)^2}$$

α = slope angle
ϕ = protection material angle of repose

4.0 DESIGN INPUTS

4.1 Water Level

Reference 2.1.6 provides the water levels at various storm events and Relative Sea Level Rise (RSLR) as represented in Table 1.

Table 1 Water Level at Varied Storm Event [Ref. 2.1.1]

Return Period	SWEL + RSLR (ft, NAVD88)
100-year	10.2 + 0.6
500-year	14.0 + 0.6

4.2 Design Conditions

The conditions considered in the Shore Protection design are as following:

- 100- and 500-year Storm Wave
- Passing Vessel in Port Arthur Channel
- Propeller Wash in LNG berthing and turning basin.

4.3 Design Condition Details

4.3.1 Shoreline Protection Design at 100-year Storm Wave

Provided by both reference 2.1.5 and 2.1.6, the wave parameters at the location of LNG basin were represented in Table 2. The average 4.4ft wave height was adopt in this shore protection design.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.
Electronic documents, once printed, are non-controlled and may become outdated.

Table 2 Design Wave at 100-year Storm

Data Source	At shoreline - wave height Hs and period Tp	In LNG basin* - wave height Hs and period Tp
From Shoreline Protection, Reference 2.1.5	4.0 ft and 3.3 seconds	2.2 ft and 3.3 seconds
From Metocean Report, Reference 2.1.6	4.8 ft and 3.8 seconds	2.6 ft and 3.8 seconds
Adopted Wave in this Shoreline Protection Design	4.4 ft and 3.8 seconds**	2.5 ft and 3.8 seconds

*Note: a diffraction coefficient of 0.55 was applied in dredged LNG basin per CEM
** Average wave height between identified sources

In this shore protection design, the adopted inputs for riprap revetment design are:

- Wave Hs = 4.4 ft and T_p = 3.8 seconds at all property shoreline.
- Wave Hs = 2.5 ft and T_p = 3.8 seconds in LNG basin.

4.3.2 Shoreline Protection Design at 500-year Storm Wave

Provided by the reference 2.1.5, the wave parameters at the location of LNG basin were represented in Table 3.

Table 3 Design Wave at 500-year Storm

Data Source	At shoreline - wave height Hs and period Tp	In LNG basin* - wave height Hs and period Tp
From Shoreline Protection, Reference 2.1.5	5.9 ft and 4.0 seconds	3.3 ft and 4.0 seconds
Adopted Wave in this Shoreline Protection Design	5.9 ft and 4.0 seconds	3.3 ft and 4 seconds

In this shore protection design, the adopted inputs for riprap revetment design are:

- Wave Hs = 5.9 ft and T_p = 4.0 seconds at all property shoreline.
- Wave Hs = 3.3 ft and T_p = 4.0 seconds in LNG basin.

4.3.3 Passing Vessel in Port Arthur Canal

Reference 2.1.6 stated that “vessel passing by Port Arthur LNG are expected to travel at speeds between 6 and 7 knots”. In this shoreline protection design, for a conservative maximum as did in Reference 2.1.6, the passing vessel’s speed with 10 knots were adopted. The particulars of the passing vessel and associated parameters are listed in the following Table 4Table 4.

Bechtel Level 2 – Confidential. Access Restricted to Authorized Individuals and Groups.

Table 4 Passing Ship Particulars

Passing Crude Oil Tanker	Characteristics
Length Overall (ft)	810
Breadth (ft)	137
Draft, loaded (ft)	40
Passing speed (knots)	10
Distance from Shoreline to CL of channel (ft)	550
Design travel speed (knot)	10

4.3.4 Propeller Wash

The PALNG Navigation Simulation provided by Client, the 4 assistant tugs with 80 mt bollard pull capacity were applied during maneuvering within turning basin and LNG basin. Thus, the Robert Allen RA 3200 tug was selected in this LNG berthing and turning basin propeller wash calculation. The assistant tugboat's particulars and associated parameters are listed in the following Table 5.

Due to the arrangement on using 4 tugs to assist the arrival and departure of the LNG vessels in the LNG terminal, the propeller wash from LNG vessel's main propulsion and thruster are not included in this calculation – LNG vessel's main propulsion and thruster are assumed to not be used in the basins.

Table 5 Design Tug Particulars

Tug – Robert Allen RAstar 3200	Characteristics
Length Overall (ft)	105 (32m)
Breadth (ft)	42 (12.8m)
Draft, loaded (ft)	19 (5.8m)
Depth (ft)	17.6 (5.37m)
Propeller Diameter (ft)	8.9 (2.7m)
Engine Power (watt) – Twin	2 x 2,240,000
Bollard Pull (mt)	80

Reference 2.1.9 stated that "pilots generally used the least tug power possible to safely complete the simulation, …… the most simulations rarely exceeded 75% sustained tug power usage". Combined with PIANC recommendation of Reference 2.2.3, the power usages of the assistant tugboats are assumed in the Table 6.

Noted that in the basin, the assistant tug is restricted to keep a minimum clearance of 50 ft from the toe of the dredged slope (fender line).

Table 6 Tug Power Usage Regarding the Separated Distance to the Toe of Slope

Distance from Toe of the Dredged Slopes	Power Usage in Berthing Basin – PIANC &Typical	Power Usage in Berthing Basin – Reference 2.1.8
More than 100 ft (about 1.0 tug LOA)	100%	75%
50 to 100 ft (about 0.5 -1.0 tug LOA)	50%	*75%
0 to 50 ft (about < 0.5 tug LOA)	Not Allowed	-

*Noted that the 75% in Reference 2.1.8 is also assumed in this range for checking the most conservative scenario.

5.0 CALCULATIONS ON MOF REVETMENT ROCK

5.1 General

The calculated rock sizes (by weight) are summarized in Table 7, while the detailed calculations are included in the attachments.

5.2 Required Rock Sizes by 100- and 500-year Storm Waves

Following table is the summary for the required rock size for the 100- and 500-year storm wave conditions. Detailed calculations are presented in Attachment A (A1 to A4). (Note: Ts = Tp/1.1 per Random Sea and Design for Maritime Structure, Goda).

Noted that the functional requirement for installed riprap shore protection is to have minimum damage “initial damage” for 100-year storm while the requirement for installed riprap levee protection is to allow certain damage of “intermediate damage” for 500-year storm.

The permeability coefficient P was categorized between 0.1 to 0.4 per CEM – most conservative and least conservative.

Table 7 Required Stone Size for 100- and 500-year Storm Wave Conditions

Location	Design Storm	Storm Wave Hs and Tp	Permeability Coefficient P	Allowed Damage Coefficient S	Required Rock Size W_{50} (lb)
Property shoreline	100-year	4.4 ft 3.8 sec	0.1 to 0.4	2 for "initial"	496 to 235
	500-year	5.9 ft 4.0 sec	0.1 to 0.4	6 for "intermediate l"	**536** to 254
LNG berthing basin	100-year	2.5 ft 3.8 sec	0.1 to 0.4	2 for "initial"	139 to 66
	500-year	3.3 ft 4.0 sec	0.1 to 0.4	6 for "intermediate"	**145** to 69

5.3 Required Rock Size by Passing Vessel

The passing vessel-generated wave and flow are calculated per BAW equations and summarized in the below table. The required rock sizes (by D_{50}) for each equation are included in the last column. Note that BAW equations for passing vessel are only to produce the required rock size but not rock weight. For the consistency with Section 5.2 and 5.4, the final rock weight determined by Figure 3-1 (Figure 6-3 in Ref 2.2.2.) is calculated by cube shape – required rock size by D_{50} is 1.12 ft and rock weight by W_{50} is 230 lb.

The results are tabulated in Table 8 below, with the detailed calculations of BAW equations presented in the Attachment B.

Table 8 Required Armor Stone Size by Passing Vessel

Items by Equations	Required Size by D_{50}
Design Transversal Stern Wave (BAW Eq 6-1)	1.53 ft
Design Primary Stern Wave (BAW Eq 6-2)	0.70 ft
Secondary Wave (BAW Eq 6-7)	0.73 ft
Return Flow Velocity (BAW Eq 6-8)	0.54 ft
Slope Supply Flow (BAW Eq 6-10)	0.62 ft
Slope Supply Flow & Primary Stern Wave (BAW Eq 6-11)	0.42 ft
BAW Figure 6-3 – Weighted in Size, ft	**1.12 ft**
BAW Figure 6-3 – Weighted in Weight, lb	**230 lb**

5.4 Required Rock Size by Propeller Wash of Tugboats

Following Table 9 is the summary for the required rock sizes for Tugboats propeller wash at varied separated distance with different power levels. In the typical propeller wash scenario per PIANC, the required rock size is 225 lb. For checking purpose, the 75% power usage in Reference 2.1.8 is also assumed at the distance range of 50 to 100 ft, then the required rock size is 506lb. Detailed design calculations are presented in Attachment C.

Table 9 Required Armour Stone Size by Propeller Wash of Tugboats

Clearance from Toe of the Dredged Slopes	Required Rock Size W_{50} (lb) - Typical	Required Rock Size W_{50} (lb) by Reference 2.1.8
More than 100 ft (> 1.0 tug LOA)	145	81
50 to 100 ft (0.5 -1.0 tug LOA)	225	506
0 to 50 ft (0.5 tug LOA)	-	-

5.5 Required Revetment Rock Size and Armor Rock Thickness

Among all scenario from section 5.2, 5.3 and 5.4, the required riprap revetment is listed in the Table 10 the section at and above water surface is subject to the action of storm wave and passing ship navigated in Port Arthur Channel while the section below water surface is only subject to propeller wash from the terminal assistant tugboats in operation. This is also applicable to the storm water drainage within the LNG basis, as wave and vessel wake will control the rock sizing.

From the varied requirements in Table 10, if a single rock size was recommended to satisfy all requirements at all locations and both of above and below water surface, it will be:

- W_{50} = 550 lb by rock weight.
- 3.0 ft thickness of rock.

The calculation of rock thickness and rock gradation are presented in Attachment A (A6).

Table 10 Summary of Required Armour Stone

	Location	Determined by	Required Rock Weight by W_{50} (lb)
Riprap Revetment Section at & above Waterline	at property shoreline	500-year storm – intermediate damage	536
		100-year storm – initial damage	496
		Passing ship at Port Author Channel	230
	at LNG basin	500-year storm – intermediate damage	145
		100-year storm – initial damage	139
		Passing ship in Port Author Channel	< 230*
Riprap Revetment Section below Waterline	at LNG basin	Propeller wash from tugboats – worst manoeuvring	506
		Propeller wash from tugboats – typical manoeuvring	225

*Not calculated but the wake diffracted into the LNG basin should be less than that at the property shoreline.

6.0 CONCLUSION AND RECOMMENDATION

Based on the Coastal Engineering Analysis, the following are recommended for the LNG Berth Shore Protection:

1. The coastal engineering calculations suggest that the following shore protection design summarized in Table 11 meets the design requirements including the storm wave, passing vessels and propeller wash in the LNG basin and property shoreline area.

2. By consolidating the rock sizes required at property shoreline and LNG basin, the recommended option is:

    - The required armour rock size by weight W_{50} is 550 lb
    - The required thickness of the 550 lb armour rock is 3.0 ft.
    - The required bedding stone size by weight W_{50} is 50 lb and thickness of bedding layer is 1.0 ft.

Table 11 Rock Size Recommendations for PALNG Shoreline and Basin Revetment

Basin and Shore Protection	Recommended Armour Rock	Recommended Bedding Stone
Rock Size by Weight W_{50}	550 lb	50 lb
Thickness of Rock Layer	3.0 ft	1.0 ft

For both 550lb armour rock and its bedding stone, the calculations on layer thickness and rock gradation are included at Attachment D (D1 for 550 lb armour rock and D2 for bedding stone).

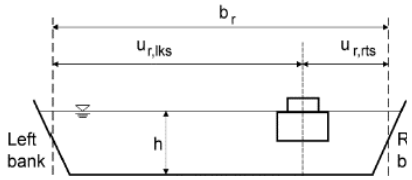
SIGNATURE: M. Liu DATE: 08-10-2023 CHECKED: C Thomas DATE: 08-15-2023

PROJECT: Port Arthur Liquefaction Project JOB NO. 26196-100

SUBJECT: Shore Protection Calculation for LNG Berth Area and Storm Water Drainage (Berth Area) SHEET27 OF 37 SHEETS 37

Project	Port Arthur LNG - Shorline Protection
Task	Armour Stone Size Required to Resist Load Caused By Transversal Stern Waves
Created by	Matt Liu
Checked by	
Standards	BAW Code and Practive Principles for the Design of Bank and Bottom Protection for inland Waterways

CONSTANT INPUTS			
Density of Water	ρ_W	1025	kg/m3
Gravity	g	9.81	m/s2
Bulk Density of Armour Stones	ρ_S	2650	kg/m3 N.B.:/TLW 2003/
Slope Angle	β	18	° cot (1/3)
Ship Length	L	247	m
Ship Width	B	42	m
Ship Speed	Vs	5.14	m/s
Water Depth	h	13	m
Flow Mean Vel. In Cross Section	V_{str}	0.5	m/s
Vessel CL to Bank Line	u_{rmin}	165	m, vessel offset 0.5Beam
Canal Width	b_r	390	m



EQ 6-1 & 6-2 INPUTS			
Coef. for wave generating ship	β_λ	0.9	0.72 for fast ship; 0.90 for inland navigation vessels and push-tow
Stability Coefficient	B'_B	1.5	1.5(lower limit of measured values) - 2.3(mean measured value)
Factor of Influence	C_H	1.3	1.3 (T/h=0.7, inland); 1.5 (T/h=0.4, partially laden); 1.1 sea-going vessel,large trim
Mean Drawdown near Bank	$\Delta\bar{h}_{u,Heck}$	1.40208	m, reference to 2.1.6 (p31 of MN report)
Distance Range	U'u	180	m, for Eq 5-54
Wave Height Coefficient	A_W	0.25	0.25 conventional inland vessel/tug; 0.35 empty, single-line push, 0.8 fully laden, multi-line push
Occurance Freq. Coef.	$B*_B$	2	2.0 frequently occurs/damage completely avoid; 3.0 infrequently/with maintenace
Critical Ship Speed	V_{krit}	8	m/s, Eq 5-19

EQ 6-1 & 6-2 INTERMEDIATE OUTPUS			
Reduction factor	f_{red}	0.53	Eq 5-54
Slope Inclination	m	3.08	$2 \le m \le 5$
Slope Influence Coef	C_{Bo}	1.11	Eq 6-8
Coef. of Velocity	f_{cr}	1.00	[1, 1.7], Eq 5-57
Coef. Of Wave Length	f_λ	0.9	$0.9\sin[\pi(2Lw/\lambda q-0.5)]$ for $4/3Lw \le \lambda q \le 2Lw$, else 0
Max Waterkeven Drawdown	$\Delta\bar{h}_{u,Heck}$	1.822704	m, Eq 5-29 (FEED report)
Trans. Wave Length	λ_q	444.6	m, Eq 5-55
Wave Generating Ship Length	Lw	222.3	m
Primary Stern Wave Height	$H_{u,Heck}$	1.62	m, Eq 5-32
Distance Case B Design Value	$H_{u,Heck,StBem}$	1.74	m, Eq 5-53
Secondary Wave Height	$H_{sek,q}$	0.46	m, Eq 5-61&65
Design Wave Height	H_{Bem}	1.62	m
		2.67	

EQ 6-1 & 6-2 RESULTS			
Required Stone Size	**D_{50}**	**0.468**	m, Eq 6-1
Required Stone Size	**D_{50}**	**0.213**	m, Eq 6-2

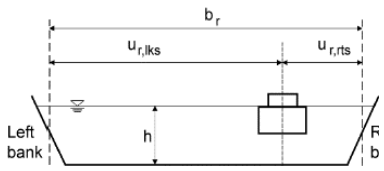
Ship Speed	Vs	5.14	m/s
Water Depth	h	13	m
Flow Mean Vel. In Cross Section	V_{str}	0.5	m/s
Vessel CL to Bank Line	u_{rmin}	165	m
Canal Width	b_r	390	m



EQ 6-7 & 6-8 INPUTS			
Coef. for wave generating ship	β_λ	0.9	0.72 for fast ship; 0.90 for inland navigation vessels and push-tow
Mean Drawdown near Bank	$\Delta\bar{n}_{u,Heck}$	1	m, reference to 2.1.6 (MN report)
Distance Range	U'u	180	m, for Eq 5-54
Wave Height Coefficient	A_w	0.25	0.25 conventional inland vessel/tug; 0.35 empty, single-line push, 0.8 fully laden, multi-line push
Bank Strickler Roughness	$K_{Str,u}$	30.00	m^(1/3)/s, Eq 5-38
Mean Strickler Roughness	K_{Str}	30.00	m^(1/3)/s, Eq 5-38
Boundary Layer Thickness	δv	1.00	m, Eq 5-38
Flow Velocity	V_{max}	1.81	m/s, Eq 5-39&40, Downstrean V_{ruck} -$V_{Str,Ufer}$; Upstream V_{ruck}+$V_{Str,Ufer}$
Critical Ship Speed	V_{krit}	**8**	m/s, Eq 5-19
Coef. of Velocity	f_{cr}	1.00	[1, 1.7], Eq 5-57
Coef. Of Wave Length	f_λ	0.9	0.9sin[π(2Lw/λq-0.5)] for 4/3Lw≤λq≤2Lw, else 0

EQ 6-7 & 6-8 INTERMEDIATE OUTPUS			
Reduction factor	f_{red}	0.53	Eq 5-54
Slope Inclination	m	3.08	2 ≤ m ≤ 5
Equivalent Width at Water Level	$b_{WS,aqui}$	430.01	m, Eq 5-11
Drawdown Area Mean Width	b_m	426.93	m, Eq 5-23
Return Flow Velocity	V_{ruch}	1.06	m/s, Eq 5-23
Slope Influence Coef	C_{Bo}	1.11	Eq 6-8
Isbash Coefficient	C_{isb}	0.70	Eq 6-8
Surf Similarity Parameter	ζ	8.28	Eq 6-7
Mean Flow Velocity	$V_{Str,Ufer}$	0.75	m/s, Eq 5-28
Trans. Wave Length	λ_q	444.6	m, Eq 5-55
Diverging Wave Length	λ_s	296.4	m, Eq 5-59
Wave Generating Ship Length	Lw	222.3	m
Secondary Wave Height	$H_{sek,q}$	0.46	m, Eq 5-61&65

EQ 6-7 & 6-8 RESULTS			
Required Stone Size	**D_{50}**	**0.22**	m, Eq 6-7
Required Stone Size	**D_{50}**	**0.16**	m, Eq 6-8

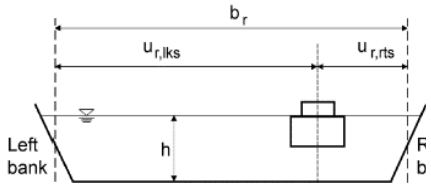
Project	Port Arthur LNG
Task	Armour Stone Size Required to Resist Load Causeddue to Slope Supply Flow
Created by	Matt Liu
Checked by	T Chris
Standards	BAW Code and Practive Principles for the Design of Bank and Bottom Protection for inland Waterways

CONSTANT INPUTS			
Density of Water	ρ_w	1025	kg/m3
Gravity	g	9.81	m/s2
Bulk Density of Armour Stones	ρ_s	2650	kg/m3 N.B.:/TLW 2003/
Slope Angle	β	18	°
Ship Length	L	247	m
Ship Width	B	42	m
Draft	T	12	m
Ship Speed	Vs	5.14	m/s
Water Depth	h	13	m
Flow Mean Vel. In Cross Section	V_{str}	0.5	m/s
Vessel CL to Bank Line	u_{rmin}	165	m
Canal Width	b_r	390	m



EQ 6-10 & 6-11 INPUTS			
Factor of Influence	C_H	1.3	1.3 (T/h=0.7, inland); 1.5 (T/h=0.4, partially laden); 1.1 sea-going vessel,large trim
Mean Drawdown near Bank	$\Delta\bar{h}_{u,Heck}$	1	m, reference to 2.1.6 (MN report)
Bank Strickler Roughness	$K_{Str,u}$	30.00	m^(1/3)/s, Eq 5-38
Mean Strickler Roughness	K_{Str}	30.00	m^(1/3)/s, Eq 5-38
Boundary Layer Thickness	δv	1.00	m, Eq 5-38

EQ 6-10 & 6-11 INTERMEDIATE OUTPUS			
Slope Inclination	m	3.08	2 ≤ m ≤ 5
Equivalent Width at Water Level	$b_{WS,aqui}$	430.01	m, Eq 5-11
Drawdown Area Mean Width	b_m	426.93	m, Eq 5-23
Slope Influence Coef	C_{Bo}	1.11	Eq 6-8
Isbash Coefficient	C_{Isb}	0.70	Eq 6-8
Max Waterkeven Drawdown	$\Delta\hat{h}_{u,Heck}$	1.3	m, Eq 5-29
Mean Flow Velocity	$V_{Str,Ufer}$	0.75	m/s, Eq 5-28
Froude Number Square	Fr^2	2.33	Eq 5-37
Max. Vel of Slope Supply Flow	Umax	1.54	m/s, Eq. 5-36
Slope Supply Flow Design Speed	$U_{max,B}$	2.29	m/s, Eq. 5-41&42, downstream Umax+VStr,Ufer, upstream Umax-VStr,Ufer
Primary Stern Wave Height	$H_{u,Heck}$	1.15	m, Eq 5-32

EQ 6-10 & 6-11 RESULTS			
Required Stone Size	**D_{50}**	**0.19**	m, Eq 6-10
Required Stone Size	**D_{50}**	**0.13**	m, Eq 6-11

The new *RAstar 3200* tug ***Eugene***, constructed by Cheoy Lee Shipyards, Hong Kong, has been delivered to its owners Kenya Ports Authority, Mombasa, Kenya. Principal particulars of this new tug are:

- Length O.A.: 32.00 m
- Beam, moulded: 12.80 m
- Depth, moulded (hull): 5.37 m
- Maximum Draft: 5.80 m

Eugene is classed and built according to the following Lloyd's Register of Shipping notation: ✠100A1, Escort Tug, ✠LMC, UMS, Fire-Fighting Ship 1 with Water Spray, Unrestricted Voyages, IWS

Main Tank Capacities are:

- Fuel Oil: 193 m³
- Fresh Water: 35 m³
- Foam: 16 m³

On trials, the ***Eugene*** met or exceeded all performance expectations, with the following results:

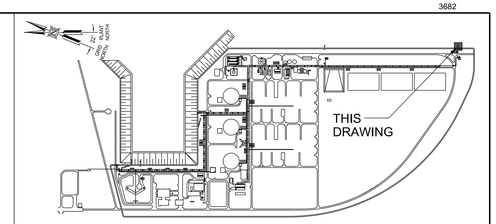
2

PC-1 TO PC-4 PILE CAP PLAN FOR OUT FALL STRUCTURE - 1

SCALE 3/16" = 1'-0"

CWP:108D1-02Z-D



KEY PLAN

NOTES:-

1. ALL DIMENSIONS AND ELEVATIONS ARE IN FEET & INCHES.
2. FOR CONCRETE GENERAL NOTES, REFERENCES AND ABBREVIATIONS SEE STD DRAWING 26196-100-DB-000-00001 (PAL-PJT-CIV-DWG-00-X-6001).
3. PILE TO PILE CAP INTERFACE DETAIL SEE DRAWING 26196-100-CP-000-00001 (PAL-PJT-CIV-DWG-00-X-4001).
4. UNO GROUT SHALL BE NON SHRINK CEMENT BASED TYPE IN ACCORDANCE WITH SPECIFICATION 26196-100-3PS-DB01-00002 (PAL-PJT-CIV-STD-00-X-0011).
5. ANCHOR BOLT SHALL BE IN ACCORDANCE WITH STD DRAWING 26196-100-DB-000-00008 (PAL-PJT-CIV-DWG-00-X-6008).
6. FOR POST INSTALLED ANCHORS, SEE DRAWING 26196-100-DB-000-00009 (PAL-PJT-CIV-DWG-00-X-6009).
7. FOR ELECTRICAL GROUNDING LAYOUT SEE GROUNDING KEY PLAN OSBL AREA DRAWING 26196-100-EG-100-00001 (PAL-T0-ELE-PLN-00-GEN-4001).
8. FOR PILE LAYOUT SEE DRAWING 26196-100-CP-100A4-04001 (PAL-T0-CIV-DWG-00-X-4001).
9. REBAR SHALL BE ADJUSTED TO AVOID CLASH WITH ANCHOR BOLT.
10. ALL CONSTRUCTION JOINT LOCATIONS SHALL BE DECIDED BY CONSTRUCTION TO SUIT AT SITE. STANDARD DETAIL-2 DRAWING 26196-100-DWG-000-00004 (PAL-PJT-CIV-DWG-00-X-6004).
11. ALL ELECTRICAL & PIPING UNDERGROUND & EMBEDMENTS SHALL BE IN PLACE PRIOR TO PLACING OF CONCRETE.
12. CONTINOUS DEWATERING OF WATER SHALL BE ENSURED DURING CONSTRUCTION OF WALLS.
13. WATERSTOP SHALL BE 4" RIBBED CENTERBULB THERMOPLASTIC ELASTOMERIC RUBBER (TPER/TPV) WATERSTOP
14. REBAR DEVELOPMENT LENGTHS AND SPLICES REFER TO DRAWING 26196-100-DB -000-00012 (PAL-PJT-CIV-DWG-00-X-6012).
15. ANY CJ IN WALL SHOULD BE BRING IN NOTICE TO RE IF REQUIRED FROM FIELD ENGINEER.
16. READ THIS DWG IN CONJUCTION WITH THE FOLLOWING DRAWINGS:
    A) 26196-100-DB-100A4-06011 (PAL-T0-CIV-DWG-00-X-6011) TO
    B) 26196-100-DB-100A4-06014 (PAL-T0-CIV-DWG-00-X-6014).

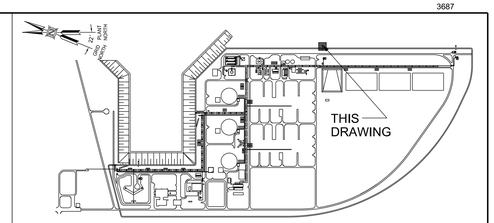
PC-1 TO PC-4 PILE CAP PLAN FOR OUT FALL STRUCTURE - 2

SCALE 3/16" = 1'-0"

CWP:108D1-01Z-D



KEY PLAN

NOTES:-

1. ALL DIMENSIONS AND ELEVATIONS ARE IN FEET & INCHES.
2. FOR CONCRETE GENERAL NOTES, REFERENCES AND ABBREVIATIONS SEE STD DRAWING 26196-100-DB-000-00001 (PAL-PJT-CIV-DWG-00-X-6001).
3. PILE TO PILE CAP INTERFACE DETAIL SEE DRAWING 26196-100-CP-000-00001 (PAL-PJT-CIV-DWG-00-X-4001).
4. UNO GROUT SHALL BE NON SHRINK CEMENT BASED TYPE IN ACCORDANCE WITH SPECIFICATION 26196-100-3PS-DB01-00002 (PAL-PJT-CIV-STD-00-X-0011).
5. ANCHOR BOLT SHALL BE IN ACCORDANCE WITH STD DRAWING 26196-100-DB-000-00008 (PAL-PJT-CIV-DWG-00-X-6008).
6. FOR POST INSTALLED ANCHORS, SEE DRAWING 26196-100-DB-000-00009 (PAL-PJT-CIV-DWG-00-X-6009).
7. FOR ELECTRICAL GROUNDING LAYOUT SEE GROUNDING KEY PLAN OSBL AREA DRAWING 26196-100-EG-100-00001 (PAL-T0-ELE-PLN-00-GEN-4001).
8. FOR PILE LAYOUT SEE DRAWING 26196-100-CP-100A4-04002 (PAL-T0-CIV-DWG-00-X-4002).
9. REBAR SHALL BE ADJUSTED TO AVOID CLASH WITH ANCHOR BOLT.
10. ALL CONSTRUCTION JOINT LOCATIONS SHALL BE DECIDED BY CONSTRUCTION TO SUIT AT SITE. STANDARD DETAIL-2 DRAWING 26196-100-DWG-000-00004 (PAL-PJT-CIV-DWG-00-X-6004).
11. ALL ELECTRICAL & PIPING UNDERGROUND & EMBEDMENTS SHALL BE IN PLACE PRIOR TO PLACING OF CONCRETE.
12. CONTINOUS DEWATERING OF WATER SHALL BE ENSURED DURING CONSTRUCTION OF WALLS.
13. WATERSTOP SHALL BE 4" RIBBED CENTERBULB THERMOPLASTIC ELASTOMERIC RUBBER (TPER/TPV) WATERSTOP
14. REBAR DEVELOPMENT LENGTHS AND SPLICES REFER TO DRAWING 26196-100-DB -000-00012 (PAL-PJT-CIV-DWG-00-X-6012).
15. ANY CJ IN WALL SHOULD BE BRING IN NOTICE TO RE IF REQUIRED FROM FIELD ENGINEER.
16. READ THIS DWG IN CONJUCTION WITH THE FOLLOWING DRAWINGS:
    A) 26196-100-DB-100A4-06021 (PAL-T0-CIV-DWG-00-X-6021) TO
    B) 26196-100-DB-100A4-06024 (PAL-T0-CIV-DWG-00-X-6024).

NOTES:-

1. ALL DIMENSIONS AND ELEVATIONS ARE IN FEET & INCHES.
2. FOR GENERAL NOTES SEE DRAWING 26196-100-DB-108B1-06151 (PAL-T0-CIV-DWG-19-X-6151).
3. READ THIS DRAWING IN CONJUCTION WITH 26196-100-DB-108B1-06151 (PAL-T0-CIV-DWG-19-X-6151).
4. COARSE SCREEN SHALL BE HOT DIP GALVANIZED IN ACCORDANCE WITH ASTM A123. DRY FILM THICKNESS FOR ZINC COATING SHALL BE 3 MILLS PER A123
5. ALL STRUCTURAL STEEL, STEEL SUPPORTS AND HOOKS FOR FINE SCREEN, STEEL SUPPORTS FOR GRATINGS (ALL SIDES, FRAME, HOOKS, & HOLES), EMBEDS (ALL SIDES), AND CHANNELS (ALL SIDES) SHALL BE PREPARED IN ACCORDANCE WITH SSPC-SP 10, NEAR WHITE METAL BLAST CLEANING AND COATED WITH 24-30 MILS OF INTERNATIONAL PAINTS INTERZONE 954 OR DUROMAR 2510. THE COATING SHALL BE APPLIED IN ACCORDANCE WITH AN APPROVED PROCEDURE INCORPORATING THE PAINT MANUFACTURER'S RECOMMENDATION. THE APPLIED COATING MUST BE ESSENTIALLY FREE OF APPLICATION RELATED DEFECTS AND HOLES/VOIDS. COATING FOR CARBON STEEL ONLY, 316 STAINLESS STEEL SHALL NOT BE COATED. FINE SCREEN ASSEMBLY, COARSE SCREEN ASSEMBLY, AND THEIR SUPPORTING COATED CHANNELS, AND COATED EMBEDS SHALL BE CATHODICALLY PROTECTED WITH SACRIFICIAL ANODE OF 5-10 YEARS DESIGN LIFE.
6. ALL PLATES AND CHANNELS SHOWN IN THE DRAWING CONFORM TO ASTM A36.
7. THE SCREEN DETAILS ARE FOR ONE UNIT.
8. ACTUAL DISTANCE BETWEEN SLOTS FOR SCREEN TO BE TAKEN FROM AS BUILT AT SITE AND WIDTH OF THE SCREEN SHALL BE ADJUSTED, IF REQUIRED (FIELD TO PROVIDE AS-BUILT DISTANCE BETWEEN SLOTS @ 1'-0" INTERVALS WITHIN THREE WEEKS OF CONCRETE PLACEMENT)

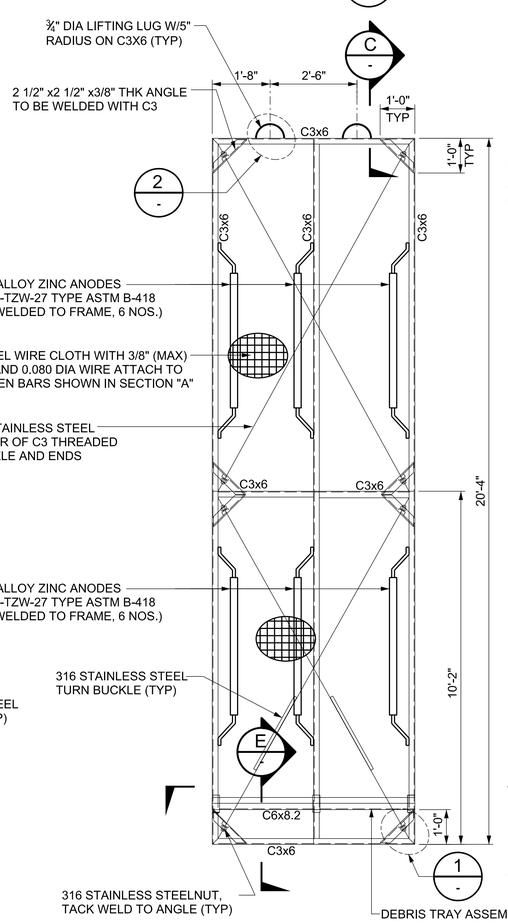
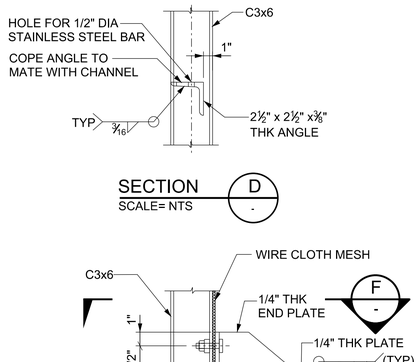
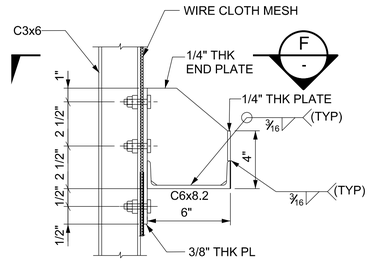
ELE VATION FOR FINE SCREEN FS-1 / SCALE 1/2" = 1'-0" (2 Nos)



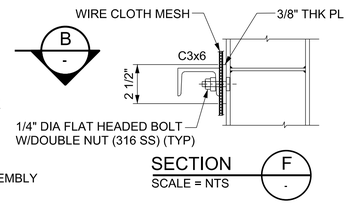
ELE VATION FOR FINE SCREEN FS-2 / SCALE 1/2" = 1'-0" (1 No)



SECTION D / SCALE= NTS



SECTION E / SCALE= NTS DEBRIS TRAY ASSEMBLY



SECTION F / SCALE = NTS

NOTES:-

1. ALL DIMENSIONS AND ELEVATIONS ARE IN FEET & INCHES.
2. FOR GENERAL NOTES SEE DRAWING 26196-100-DB-108D1-06318 (PAL-T0-CIV-DWG-19-X-6318).
3. READ THIS DRAWING IN CONJUCTION WITH 26196-100-DB-108D1-06318 (PAL-T0-CIV-DWG-19-X-6318).
4. COARSE SCREEN SHALL BE HOT DIP GALVANIZED IN ACCORDANCE WITH ASTM A123. DRY FILM THICKNESS FOR ZINC COATING SHALL BE 3 MILLS PER A123
5. ALL STRUCTURAL STEEL, STEEL SUPPORTS AND HOOKS FOR FINE SCREEN, STEEL SUPPORTS FOR GRATINGS (ALL SIDES, FRAME, HOOKS, & HOLES), EMBEDS (ALL SIDES), AND CHANNELS (ALL SIDES) SHALL BE PREPARED IN ACCORDANCE WITH SSPC-SP 10, NEAR WHITE METAL BLAST CLEANING AND COATED WITH 24-30 MILS OF INTERNATIONAL PAINTS INTERZONE 954 OR DUROMAR 2510. THE COATING SHALL BE APPLIED IN ACCORDANCE WITH AN APPROVED PROCEDURE INCORPORATING THE PAINT MANUFACTURER'S RECOMMENDATION. THE APPLIED COATING MUST BE ESSENTIALLY FREE OF APPLICATION RELATED DEFECTS AND HOLES/VOIDS. COATING FOR CARBON STEEL ONLY, 316 STAINLESS STEEL SHALL NOT BE COATED. FINE SCREEN ASSEMBLY, COARSE SCREEN ASSEMBLY, AND THEIR SUPPORTING COATED CHANNELS, AND COATED EMBEDS SHALL BE CATHODICALLY PROTECTED WITH SACRIFICIAL ANODE OF 5-10 YEARS DESIGN LIFE.
6. ALL PLATES AND CHANNELS SHOWN IN THE DRAWING CONFORM TO ASTM A36.
7. THE SCREEN DETAILS ARE FOR ONE UNIT.
8. ACTUAL DISTANCE BETWEEN SLOTS FOR SCREEN TO BE TAKEN FROM AS BUILT AT SITE AND WIDTH OF THE SCREEN SHALL BE ADJUSTED, IF REQUIRED (FIELD TO PROVIDE AS-BUILT DISTANCE BETWEEN SLOTS @ 1'-0" INTERVALS WITHIN THREE WEEKS OF CONCRETE PLACEMENT)

NOTES:-

1. ALL DIMENSIONS AND ELEVATIONS ARE IN FEET & INCHES.
2. FOR GENERAL NOTES SEE DRAWING 26196-100-DB-109B1-06525 (PAL-T0-CIV-DWG-19-X-6525).
3. READ THIS DRAWING IN CONJUCTION WITH 26196-100-DB-109B1-06525 (PAL-T0-CIV-DWG-19-X-6525).
4. COARSE SCREEN SHALL BE HOT DIP GALVANIZED IN ACCORDANCE WITH ASTM A123. DRY FILM THICKNESS FOR ZINC COATING SHALL BE 3 MILLS PER A123
5. ALL STRUCTURAL STEEL, STEEL SUPPORTS AND HOOKS FOR FINE SCREEN, STEEL SUPPORTS FOR GRATINGS (ALL SIDES, FRAME, HOOKS, & HOLES), EMBEDS (ALL SIDES), AND CHANNELS (ALL SIDES) SHALL BE PREPARED IN ACCORDANCE WITH SSPC-SP 10, NEAR WHITE METAL BLAST CLEANING AND COATED WITH 24-30 MILS OF INTERNATIONAL PAINTS INTERZONE 954 OR DUROMAR 2510. THE COATING SHALL BE APPLIED IN ACCORDANCE WITH AN APPROVED PROCEDURE INCORPORATING THE PAINT MANUFACTURER'S RECOMMENDATION. THE APPLIED COATING MUST BE ESSENTIALLY FREE OF APPLICATION RELATED DEFECTS AND HOLES/VOIDS. COATING FOR CARBON STEEL ONLY, 316 STAINLESS STEEL SHALL NOT BE COATED. FINE SCREEN ASSEMBLY, COARSE SCREEN ASSEMBLY, AND THEIR SUPPORTING COATED CHANNELS, AND COATED EMBEDS SHALL BE CATHODICALLY PROTECTED WITH SACRIFICIAL ANODE OF 5-10 YEARS DESIGN LIFE.
6. ALL PLATES AND CHANNELS SHOWN IN THE DRAWING CONFORM TO ASTM A36.
7. THE SCREEN DETAILS ARE FOR ONE UNIT.
8. ACTUAL DISTANCE BETWEEN SLOTS FOR SCREEN TO BE TAKEN FROM AS BUILT AT SITE AND WIDTH OF THE SCREEN SHALL BE ADJUSTED, IF REQUIRED (FIELD TO PROVIDE AS-BUILT DISTANCE BETWEEN SLOTS @ 1'-0" INTERVALS WITHIN THREE WEEKS OF CONCRETE PLACEMENT)

TPWD MONUMENT = PLANT COORDINATES:
N 13,872,197.79 N. 20,000'-0"
E 3,568,342.28 E. 10,000'-0"
29° 47' 52.61" N EL. +7'-0" (HPFS)
93° 57' 15.07" W

NOTES:
4. THERMAL RADIATION RISK CONTOUR AT 10,000 BTU/FT2-HR
5. THERMAL RADIATION RISK CONTOUR AT 4,000 BTU/FT2-HR

GENERAL NOTES:
A) UNLESS OTHERWISE NOTED, ALL DIMENSIONS, ELEVATIONS AND COORDINATES ARE IN FEET AND INCHES.
B) HORIZONTAL DIMENSIONAL CONTROL SHALL BE BASED ON U.S. STATE PLANE COORDINATE SYSTEM, LAMBERT PROJECTION, NAD83, TEXAS SOUTH CENTRAL ZONE, U.S. SURVEY FOOT.
C) ALL VERTICAL DIMENSIONAL CONTROL IS BASED ON NORTH AMERICAN VERTICAL DATUM 1988 (NAVD88).

NOTES:
1. HIGH POINT OF FINISHED SURFACE (HPFS) ELEVATION = NORTH AMERICAN VERTICAL DATUM 1988 (NAVD88) ELEVATION + 7'-0". NAVD88 ELEVATION = MEAN SEA LEVEL (MSL) -0.59 FT.
2. PALNG PLANT COORDINATE SYSTEM ORIGINATES FROM TPWD MONUMENT LOCATED AT 29° 47' 52.61" N AND 93° 57' 15.07" W. PLANT COORDINATES N. 20,000'- 0" AND E. 10,000'- 0" ARE EQUAL TO TEXAS STATE PLANE COORDINATES N. 13,872,197.79 FT. AND E. 3,568,342.28 FT.
3. OTHER PALNG PLANT COORDINATES CORRESPONDING TO TEXAS STATE PLANE COORDINATES AT MONUMENTS AS IDENTIFIED ON THE DRAWING ARE AS FOLLOWS:

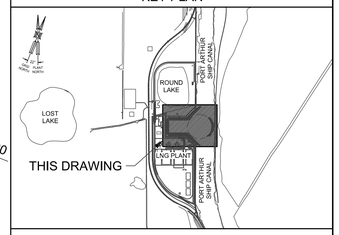
KEY PLAN



NOTES:

1. UNLESS OTHERWISE SPECIFIED, ALL DIMENSIONS ARE IN FEET.
2. COORDINATES ARE IN FEET TO NAD 83 / TEXAS STATE PLANE SOUTH CENTRAL ZONE.
3. ELEVATIONS ARE IN FEET TO NAVD88.
4. FOR THE PLAN OF COMBIWALL, SEE DWG. NO. 26196-100-R0-100A2-00201 (PAL-T0-MAR-DWG-24-GEN-0201).
5. TOP OF FINISHED 10 FEET OF PILE TO BE COATED ACCORDING TO PROJECT SPECIFICATION 26196-100-3PS-NX00-00001.
6. SHEET PILES TO BE INSTALLED ACCORDING TO PROJECT SPECIFICTION 26196-100-3PS-CM00-00005.
7. DESIGN DOES NOT REQUIRE CATHODIC PROTECTION, AS PER RECOMMENDATION FROM MET.

FOR SEALED GEOTCHNICAL DESIGN REFER TO REPORT 26196-100-I23-GEK-00553.

Guidance for Flood Risk Analysis and Mapping

Coastal Structures

November 2024

FEMA

This page intentionally left blank

Requirements for the Federal Emergency Management Agency (FEMA) Risk Mapping, Assessment, and Planning (Risk MAP) Program are specified separately by statute, regulation, or FEMA policy (primarily the Standards for Flood Risk Analysis and Mapping). This document provides guidance to support the requirements and recommends approaches for effective and efficient implementation. Alternate approaches that comply with all requirements are acceptable.

For more information, please visit the FEMA Guidelines and Standards for Flood Risk Analysis and Mapping webpage (https://www.fema.gov/guidelines-and-standards-flood-risk-analysis-and-mapping). Copies of the Standards for Flood Risk Analysis and Mapping policy, related guidance, technical references, and other information about the guidelines and standards development process are all available here. You can also search directly by document title at https://www.fema.gov/resource-document-library.

1. Topic Overview

This guidance document supports the standards related to approving coastal protection structures to be shown as providing protection on Flood Insurance Rate Maps (FIRMs) and outlines methods for analyzing the stability and effects of coastal structures during the 1-percent-annual-chance flood conditions.

Because coastal structures can significantly affect local topography and flood hazards, Mapping Partners must evaluate coastal structures as part of any flood hazard study. The evaluation should, where possible, determine whether a coastal structure will survive the 1-percent-annual-chance flood and what impacts it will have on upland flooding.

Criteria for evaluating the stability and performance of coastal armoring structures for Flood Risk Project purposes are well-developed and are discussed in detail. Criteria for evaluating beach stabilization structures have not been developed yet, and only basic guidance is provided. Criteria for evaluating miscellaneous structures are not standardized, and only basic guidance is provided. The Mapping Partner should coordinate with FEMA when only basic guidance is provided. Treatment of each structure must be clearly documented in the Technical Study Data Notebook (TSDN).

2. Evaluation Criteria

Mapping Partners are not required to perform detailed engineering evaluations of all coastal structures within the study area. During a flood risk study, engineering judgment is typically used in determining whether a structure should remain intact, failed, or removed from the analysis. A prudent analysis will analyze several scenarios and adopt the most conservative results. However, when such a detailed structure evaluation is performed, there are specific evaluation criteria that must be applied.

2.1. Detailed Engineering Evaluation of Coastal Armoring Structures

Where a Mapping Partner chooses to perform a detailed engineering evaluation of an existing coastal armoring structure during a Flood Risk Project, FEMA requires the evaluation to be based upon the criteria outlined below, and upon as-built documentation. When as-built documents are not available, the evaluation should be based upon best available data, standard design and engineering assumptions, and conservative estimates of material properties. The evaluation should be confirmed and documented by past performance during severe storm events. The underlying requirement is that the evaluation must yield an accurate assessment of coastal structure performance during the 1-percent-annual-chance flood, based upon available evidence.

It should be noted, however, that the art of coastal structure evaluation is constantly evolving. However, permission should be obtained from the FEMA Project Officer prior to utilizing alternative evaluation procedures and criteria.

General

For purposes of the National Flood Insurance Program (NFIP), FEMA will only recognize in its flood hazard and risk mapping effort those coastal flood protection structures that meet, and continue to meet, minimum design and maintenance standards that are consistent with the level of protection sought through the comprehensive floodplain management criteria cited in the Code of Federal Regulations (CFR) at Title 44, Chapter 1, Section 60.3 (44 CFR § 60.3).

Accordingly, the procedure describes the types of information FEMA needs to recognize, on NFIP maps, that a coastal flood protection structure will survive and impact upland flooding during the base flood. This information must be supplied to FEMA by the community or other party seeking recognition of such a coastal flood protection structure at the time a flood risk study or restudy is conducted, when a map revision under the provision of 44 CFR Part 65 is sought based on a coastal flood protection structure, and upon request by the FEMA Administrator during the review of previously recognized structures. The FEMA review will be for the sole purpose of establishing appropriate Special Flood Hazard Areas (SFHAs) for NFIP maps and shall not constitute a determination by FEMA as to how a structure will perform in a flood event.

Design Criteria

For coastal flood protection structures to be recognized by FEMA, sufficient evidence must be provided that adequate design, construction, and maintenance have been undertaken to provide reasonable assurance of durable protection from the base flood. The following requirements must be met:

1. Design Parameters. A coastal flood protection structure must be designed using physical parameters that fully represent the base flooding event, including the following:
    a. Design water levels evaluated should range from the mean low water at the site, to the 1-percent-annual-chance stillwater elevation (SWEL). The full range of elevations must be examined to determine the critical water level because the most severe conditions may not occur at either extreme.
    b. Wave heights and periods must be calculated for each water level analyzed. At a minimum, significant wave heights and periods should be used for “flexible” structures such as revetments, and larger wave heights, up to the 1-Percent-annual-chance wave height (1.67 times the significant wave height), used for more rigid structures such as seawalls and bulkheads. The U.S. Army Corps of Engineers (USACE) Coastal Engineering Manual, provides guidance and procedures for determining appropriate wave heights and periods.
    c. Breaking wave forces under structure-perpendicular loading must be considered in the design unless it can be demonstrated that the structure will not be subject to breaking waves. The very high, short duration “shock” pressures must be used for low mass structures such as bulkheads, while only the secondary “non-shock” pressures need to be used for massive structures such as gravity seawalls. Analyses

of the breaking wave forces using methods such as those identified in the USACE report "Criteria for Evaluating Coastal Flood Protection Structures," (WES TR CERC-89-15) must be submitted.

2. Minimum Freeboard. The minimum freeboard for coastal flood protection structures to be recognized on FEMA flood maps for protection against the storm surge component of the base flood shall be 2 feet above the 1-percent-annual-chance SWEL [and 1 foot above the height of the 1-percent-annual-chance wave or the maximum wave runup (whichever is greater)]. Maximum wave runup can be determined applying the appropriate conversion factor based on the resulting runup wave height:

    a. $R_{max} = R_{mean} * 2.87$

    b. $R_{max} = R_{2\%} * 2.87/2.23 = R_{2\%} * 1.29$

3. Toe Protection. The loss of material and profile lowering seaward of the structures must be included in the design either through the incorporation of adequate toe protection or an evaluation of structural stability with potential scour equal to the maximum wave height on the structure. Engineering analyses such as those recommended in the USACE's Geotechnical Engineering in the Coastal Zone (WES IR CERC-87-1) or Design of Coastal Revetments, Seawalls, and Bulkheads (COE EM 1110-2-1614) must be submitted for toe protection, or an analysis of scour potential such as found in Criteria for Evaluating Coastal Flood Protection Structures (WES TR CERC-89-15) must be submitted.

4. Backfill Protection. Engineering analyses of wave runup, overtopping, and transmission must be performed using methods provided in the USACE report "Criteria for Evaluating Coastal Flood Protection Structures," (WES TR CERC-89-15). Where the structure height is not sufficient to prevent overtopping and/or wave transmission, protection of the backfill must be included in the design. This should address prevention of loss of backfill by rundown over the structures, by drainage landward, under, and laterally around the ends of the structure as well as through joints, seams, or drainage openings in the structures.

5. Structural Stability, Minimum Water Level. Analyses of the ability of the structures to resist the maximum loads associated with the minimum seaward water level, no wave action, saturated soil conditions behind the structures, and maximum toe scour must be submitted. For coastal dikes and revetments, geotechnical analyses of potential failure in a landward direction by rotational gravity slip must be submitted.

    a. For coastal dikes and revetments, geotechnical analyses of potential failure in a landward direction by rotational gravity slip must be submitted.

    b. For gravity and pile-support seawalls, engineering analyses of seaward sliding, seaward overturning, and foundation adequacy using the maximum pressures developed in the sliding and overturning calculations must be submitted.

    c. For anchored bulkheads, engineering analyses of shear failure, moment failure, and the adequacy of the tiebacks and deadmen to resist the loadings must be submitted.

6. Structural Stability, Critical Water Level. Analyses of the ability of the structure to resist the maximum loads associated with the critical water level, which may be any water level from the mean low water level to the 1-percent-annual-chance SWEL, including hydrostatic and hydrodynamic (wave) loads, saturated soil conditions behind the structure, and maximum toe scour must be submitted.

    a. For coastal dikes and revetments, geotechnical analyses of potential failure in a seaward direction by rotational gravity slip and of foundation failure due to inadequate bearing strength must be submitted.

    b. For revetments, engineering analyses of the rock, riprap, or armor block stability under wave action; uplift forces on the rock, riprap, or armor blocks; toe stability; and adequacy of the graded rock and geotechnical filters must be submitted.

    c. For gravity and pile-supported seawalls, engineering analyses of landward sliding, landward overturning, and foundation adequacy using the maximum pressures developed in the sliding and overturning calculations must be submitted.

    d. For anchored bulkheads, engineering analyses of shear failure and moment failure using “shock” pressures must be submitted.

7. Material Adequacy. Documentation and/or analyses must be submitted that demonstrate that the materials used for the construction of the structure are adequate and suitable, including life expectancy considerations, for the conditions that exist at the site.

8. Ice and Impact Alignment. Where appropriate, analyses of ice and impact forces must be submitted.

9. Structure Plan Alignment. A shore protection project should present a continuous structure with redundant return walls at frequent intervals to isolate locations of failure. Isolated structures, or structures with a staggered alignment, must submit analyses of the additional forces from concentrated, diffracted, and/or reflected wave energy on the different sections and ends.

10. Other Design Criteria. FEMA will require that flood protection structures described above, regardless of type, be evaluated on the basis of how they may react structurally to applied forces. Therefore, analyses normally required of one structure type may also be required by another type that would react in a similar manner to applied forces. In unique situations, FEMA may require that other design criteria and analyses be submitted to show that the structure provides adequate protection. In such situations, sound engineering practice will be the standard on which FEMA will base its determinations. FEMA will provide the rationale for requiring any additional information.

Adverse Impact Evaluation

All requests for flood map revisions based upon new or enlarged coastal flood control structures shall include an analysis of potential adverse impacts of the structure on flooding and erosion within, and adjacent to, the protected area.

Community and/or State Review

For coastal flood protection structures to be recognized, evidence must be submitted to show that the design, maintenance, and impacts of the structures have been reviewed and approved by the affected communities and by any federal, state, tribe, territory or local agencies that have jurisdiction over flood control and coastal construction activities.

Operation and Maintenance Plans

For a coastal flood protection structure to be recognized, the structure must be maintained in accordance with an official adopted operations and maintenance plan. A copy of this plan must be provided to FEMA by the owner of the structure when recognition is being sought or when the plan for a previously recognized structure is revised in any manner. All operation and maintenance activities must be under the jurisdiction of a federal or state agency, an agency created by federal or state law, or any agency of a community participating in the NFIP that must assume ultimate responsibility for maintenance. This plan must document the formal procedure that ensures that the stability, height, and overall integrity of the structure and its associated structures and systems are maintained.

At a minimum, maintenance plans may specify the maintenance activities to be performed, the frequency of their performance, and the person by name or title responsible for their performance. All operation of closure devices mechanical systems must occur in accordance with the plan, regardless of whether the systems are manual or automatic. Following 44 CFR 65.6(a)(12), which describes maintenance activities required for a watercourse, 44 CFR 65.6(a)(13) documents for an exception as follows:

"Notwithstanding any other provisions of § 65.6, a community may submit, in lieu of the documentation specified in § 65.6(a)(12), certification by a registered professional engineer that the project has been designed to retain its flood carrying capacity without periodic maintenance."

Coastal floodplains do not qualify as a "watercourse" under regulations, and as such, certified coastal structures must meet a higher standard of certification beyond retaining flood carrying capacity as specified in the CFR, which includes submission of an operation and maintenance plan for the design life of the structure as outlined in this guidance document.

The Mapping Partner may ascertain (through discussions with the community and property owners) whether operation and maintenance plans exist for coastal structures that are expected to remain intact during 1-percent-annual-chance flood conditions. Mapping Partners may not have sufficient resources and time to conduct detailed evaluations of the operation and maintenance of each coastal structure within the study area. In such cases, the Mapping Partner may make an engineering judgment about the adequacy of structure operation and maintenance. The Mapping Partner must document data, materials, and assumptions associated with the flood hazard determinations related to structure operation and maintenance. Communities and property owners should be made aware that these evaluations are for mapping purposes only.

Certification Requirements

Data and analyses submitted to support that a given coastal flood protection structure complies with the structural design requirements set forth in paragraphs 1 through 10 above must be certified by a registered professional engineer. Also, certified as-built plans of the structure must be submitted. Certifications are subject to the definition given at 44 CFR § 65.2. In lieu of these certification requirements, a Federal agency with responsibility for design of coastal flood protection structures may certify that the structure has been adequately designed and constructed to provide base flood protection.

2.2. Coastal Armoring Structure Evaluation Based on Limited Data and Engineering Judgment

For the purposes of flood risk study, the Mapping Partner may not have sufficient resources and time to conduct a detailed evaluation of each coastal armoring structure within the study area. In such cases, the Mapping Partner can apply engineering judgment (albeit, guided by the guidance in Section 2.1 and USACE CERC Technical Report 89-15 Criteria for Evaluating Coastal Flood Protections Structures) to determine the likely stability of each structure during the 1-percent-annual-chance flood. These conclusions may be based largely on available archive information and local observations, including historic evidence of storm damage and maintenance. Note that any data and procedures used in the evaluations shall be documented, and communities and property owners shall be made aware that these evaluations are for mapping purposes only.

If the available information does not clearly point to survival or failure of a coastal structure, the Mapping Partner may either:

1. Conduct a detailed evaluation based on the FEMA criteria (see the previous subsection).
2. Perform the erosion and wave analyses for both the intact and failed structure cases and map the flood hazards associated with the more hazardous case.

If option 2 is selected, the Mapping Partner shall clearly document the results of all cases investigated and specify which case is used for mapping purposes. It should be noted that a failed coastal structure may or may not yield the greatest flood hazards. Therefore, coastal flood analyses for the intact and failed conditions should be performed, with the greatest resulting flood hazard being mapped. Maintaining results of all analyses may be useful in the event map revisions are requested by property owners based upon certified structures[1].

[1] Often, property owners request revisions to the FIRM based upon existing, new, or proposed coastal structures. Map revisions based upon coastal structures require a detailed evaluation and certification by a professional engineer registered in the subject State. FEMA has distributed the *Coastal Structure Form* (MT-2, Form 5, available at https://www.fema.gov/sites/default/files/documents/fema_form-5_coastal-structures-form_ff-206-fy-21-104.pdf) to evaluate coastal structures as the basis for map revisions.

2.3. Evaluation of Beach Stabilization Structures

Guidance on how to predict the survival or failure of groins, which usually fail by loss of profile (through settlement, displacement, or deterioration) and/or by becoming detached at their landward ends, is not readily available. Likewise, guidance on how to predict the failure of breakwaters, sills, and reefs (usually through loss of profile) is not readily available. Some information on failure modes may be available in technical or historical literature, and should be consulted by the Mapping Partner.

If a Mapping Partner chooses to evaluate beach stabilization structures during flood risk study, the proposed evaluation methods and procedures should be discussed with the FEMA Project Officer, in advance, and approval by FEMA must be obtained before the evaluations can be carried out.

3. Flood Risk Project Treatment of Coastal Structures

Technical Report 89-15 identifies four primary functional types of coastal flood protection structures: gravity seawalls, pile-supported seawalls, anchored bulkheads, and dikes or levees. A fifth type, revetment, is added here (see Figures 1 & 2).

Technical Report 89-15 recommends as a general policy that "FEMA not consider anchored bulkheads as providing flood protection during large storms." Thus, the default assessment for open coast anchored bulkheads should be that they are assumed to fail during the 1-percent-annual-chance flood. Mapping Partners may choose to treat some anchored bulkheads as surviving the flood and/or providing some degree of flood protection, but those instances should be limited (e.g., to sheltered waters, where the bulkhead may be stable during 1-percent-annual-chance flood conditions).

Many seawalls, revetments, and (some) bulkheads may be recognized on flood hazard maps if analysis based on the evaluation criteria in Section 2.1 shows they will remain intact during the 1annual-chance storm (in some cases, even if overtopped). These structures may provide total or limited protection against flooding, erosion, and waves, depending upon their location, strength, and dimensions.

3.1. Failure and Removal of Coastal Armoring Structures

In the event that a coastal structure is determined to fail, the Mapping Partner shall remove the structure entirely from the analysis transect or estimate the partial collapse of the structures where appropriate (see Subsection 3.2). In general, structures may be completely removed if they are small and/or localized features such as non-engineered revetments; however, structures that are not expected to be completely destroyed and removed during a 1-percent-annual-chance event, such as large-scale, engineered rick revetments, should not. If the failed structure is removed entirely, the remaining soil profile should be altered to achieve its likely slope immediately after structure failure. Information on slopes behind failed structures is limited. These slopes may vary from 1 on 100 (v:h)

for unconsolidated sands, to 1:1 or steeper for consolidated material landward of the failed structure.

For the purposes of a coastal Flood Risk Project, the post-failure slope for this analysis should be in the range of 1:1 to 1:1.5 (v:h). Note that the post-failure slope may not necessarily match the long-term stable slope, but will serve as the basis for subsequent site-specific, event-based erosion, wave height, wave runup, and wave overtopping analyses.

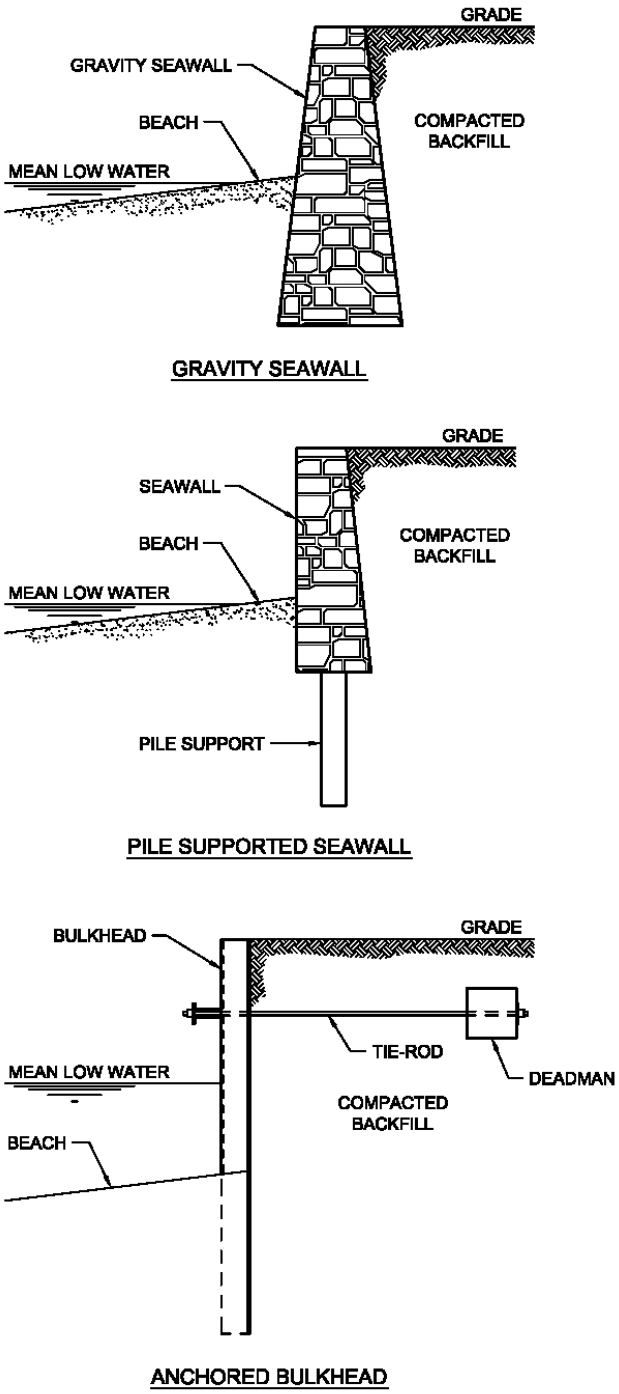

Figure 1: General Classification of Coastal Armoring Structures

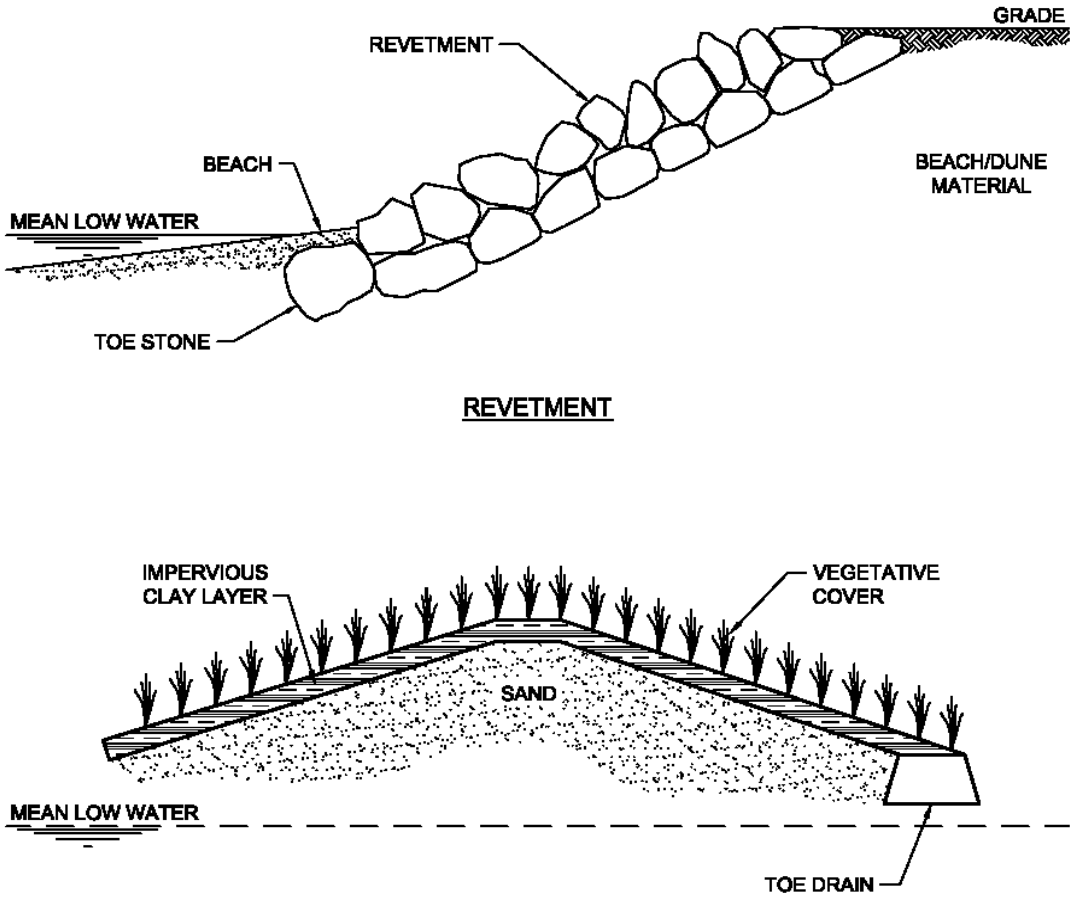

Figure 2: General Classification of Coastal Armoring Structures

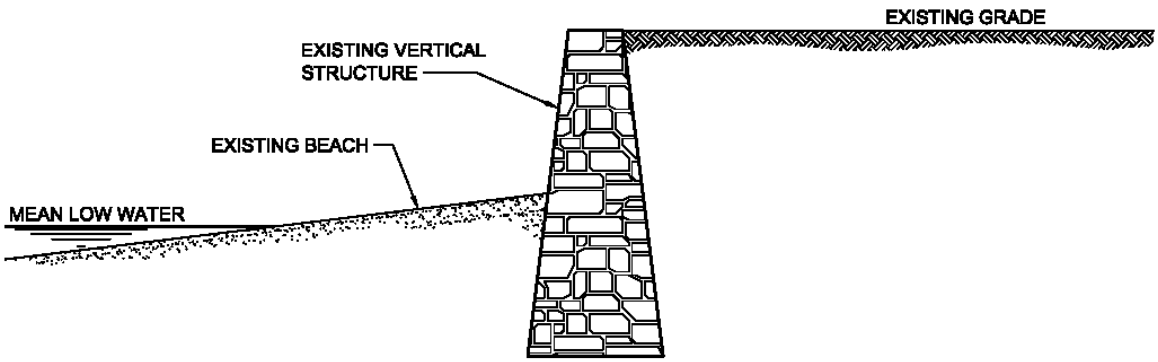
3.2. Partial Failure of Coastal Armoring Structures

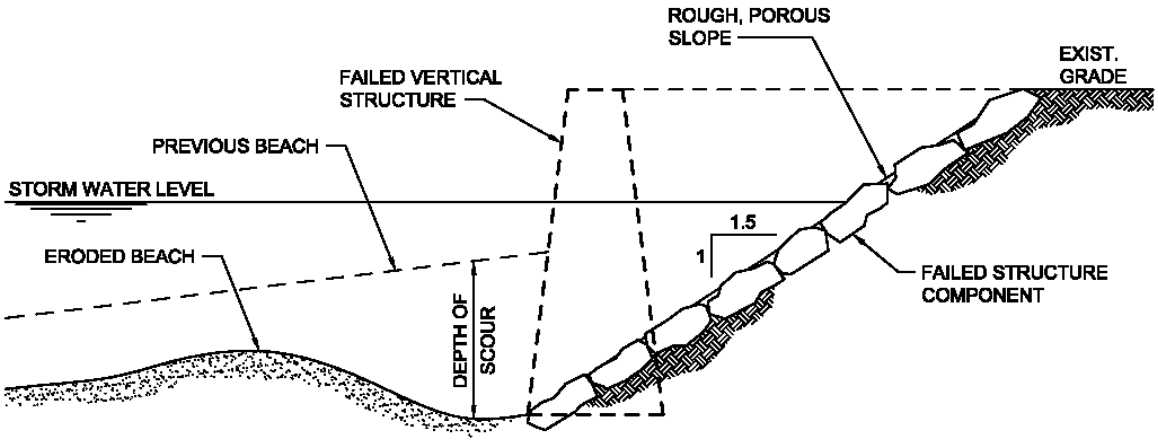
It may be appropriate to assume partial failure of such structures and to model accordingly. A recommended simple geometric approach for approximating partial failure of a vertical or near-vertical coastal armoring structure is as follows (see Figure 3):

1. Estimate toe scour at the subject structure based upon the methods described in the Coastal Engineering Manual (USACE, 2003) www.publications.usace.army.mil/usace-publications/engineer-manuals/?udt_43544_param_page=1.

2. Assume the structure fails and falls into a rough, porous slope at 1:1.5 (v:h).
3. Extend the 1:1.5 failure slope from the depth of scour at the structure toe landward to the point where it intersects the existing grade.



VERTICAL STRUCTURE GEOMETRY PRIOR TO FAILURE



VERTICAL STRUCTURE FAILURE GEOMETRY

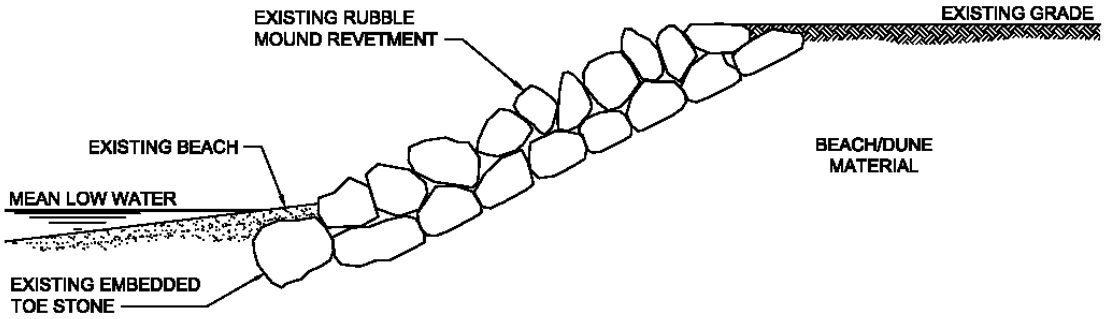
PARTIAL FAILURE OF VERTICAL COASTAL STRUCTURE

Figure 3: Partial Failure of Vertical Coastal Structure

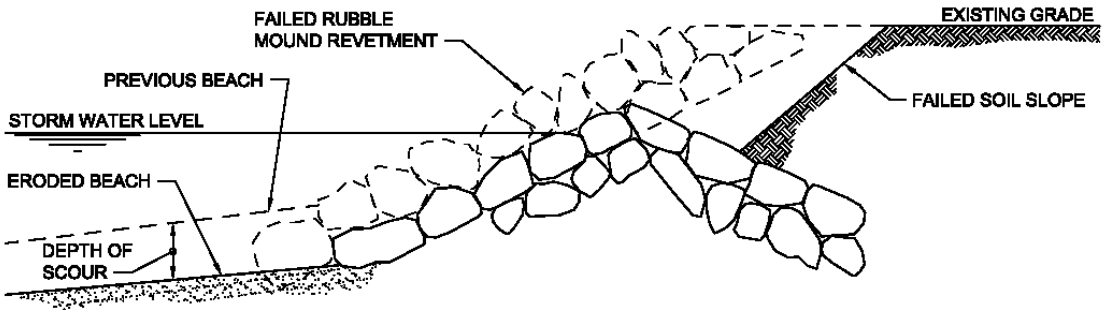
A recommended approach for approximating partial failure of a sloping revetment (due to undermining at the toe, or to collapse at the top due to erosion behind the structure) is as follows (see Figure 4):

1. Assume scour at the base of the structure is equal to the depth of the armor layer.
2. Assume the structure will collapse in place into a triangular section throughout the structure footprint, with side slopes equal to the original structure slope.
3. Assume the landward side of the failed configuration will be half exposed and half buried. Approximate the soil slope landward from the failed structure at a slope in the range of 1:1 to 1:1.5 (v:h).

After determining an appropriate failure configuration, the Mapping Partner shall conduct overland wave height propagation and wave runup analyses upon the failed structure. The Mapping Partner shall select an appropriate roughness factor when conducting runup and overtopping analyses on the failed structure.



REVETMENT GEOMETRY PRIOR TO FAILURE



REVETMENT FAILURE GEOMETRY

PARTIAL FAILURE OF A SLOPING REVETMENT

Figure 4: Partial Failure of a Sloping Revetment

3.3. Buried Coastal Structures

Some buried structures are of a size and construction to possibly affect coastal flood hazards, and should—like exposed structures—be considered during the Flood Risk Project.

Once the Mapping Partner has determined that a coastal structure is likely buried at a site, the next steps are to collect information about the structure and follow the study process outlined in Figure 5. The erosion analysis will result in one of the following two scenarios: 1) the buried structure will

remain buried during the 1-percent-annual-chance flood (see Figure 6), or 2) the buried structure will be exposed by the 1-percent-annual chance flood (see Figure 7).

Note that the buried structure study process need not be followed unless the presence of buried structures is known or is highly likely. Field investigations are not required to identify buried coastal structures. There may be some instances where limited field work (such as soil probes to locate the structure) might be useful, but this should be limited to cases where large buried structures are known to exist.

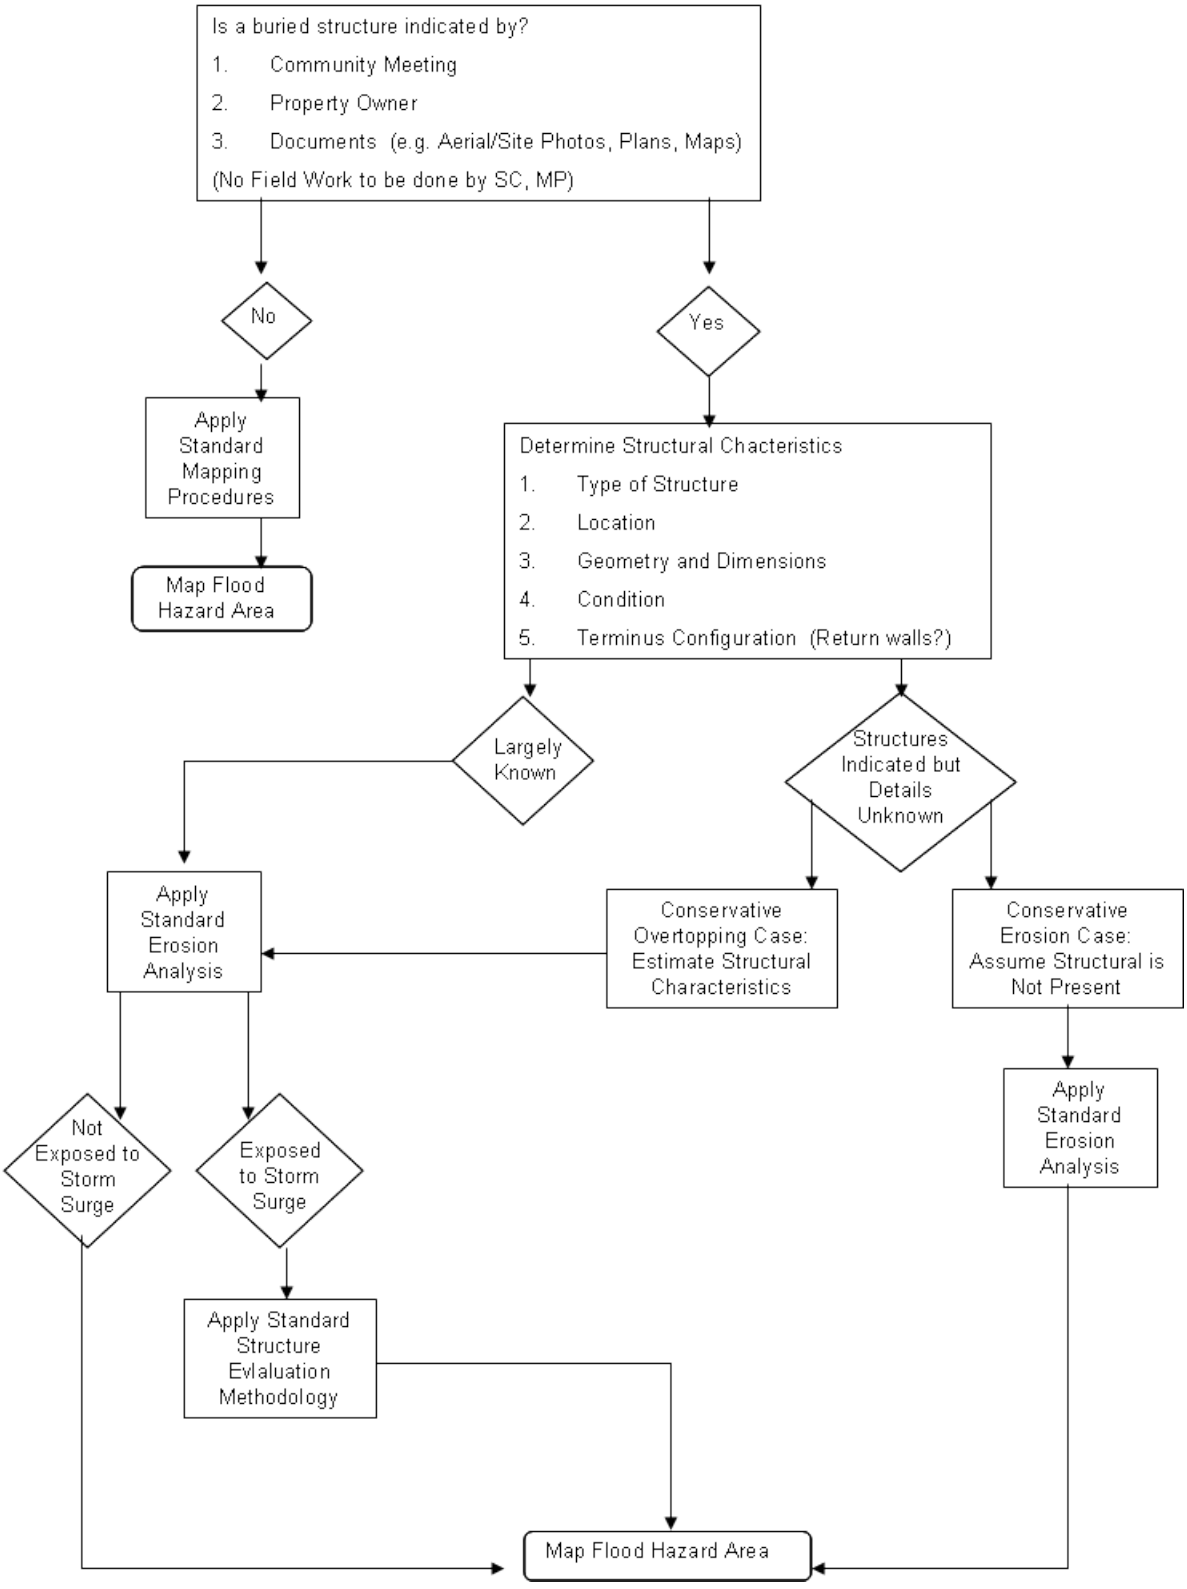


Figure 5: Methodology for Evaluating Buried Coastal Structures

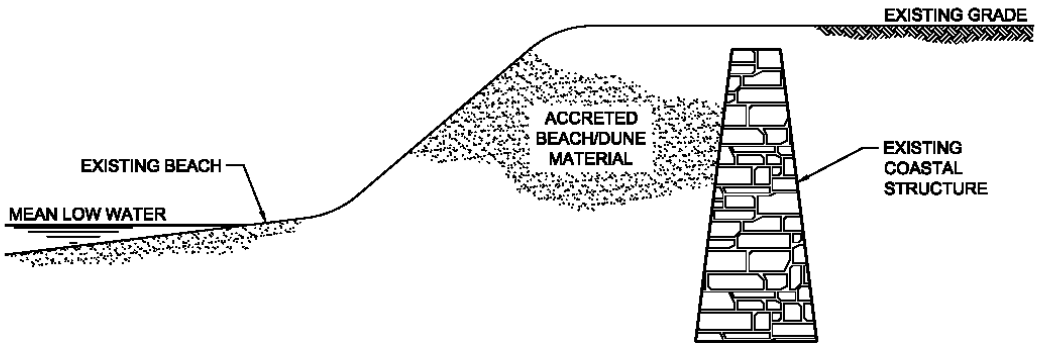

Figure 6: Buried Structure Remains Buried During 1-Percent-Annual-Chance Flood

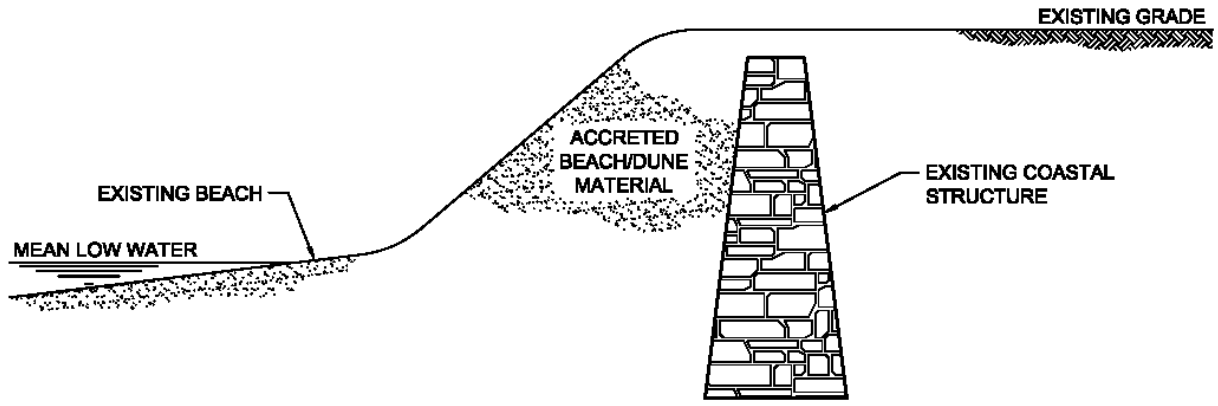

Figure 7: Buried Structure Exposed During 1-Percent-Annual-Chance Flood

3.4. Coastal Levees

All levees are subject to Levees Guidance. Levees Guidance is accessible through the FEMA Guidelines and Standards for Flood Risk Analysis and Mapping webpage.

4. Flood Risk Project Treatment of Coastal Structures in Sheltered Waters

In sheltered waters, the Mapping Partner should use the recommended guidance below:

- Coastal Armoring Structures, Navigation Structures, and Beach Stabilization Structures (e.g. revetments, seawalls, jetties, quay walls, groins, breakwaters): These structures should generally be left intact in the storm surge model setup, unless the Mapping Partner has reason to believe that the failure or removal of such structures will best represent hydromorphologic conditions during storms; in such cases, the Mapping Partner should consult with the FEMA Project Officer prior to making final decisions regarding failure or removal of these structures. These structures should be evaluated for stability per existing guidance (for coastal armoring structures, miscellaneous or beach stabilization structures), as appropriate, during the analysis of overland wave propagation, wave runup, wave overtopping, etc. In instances where Total Water Levels (TWLs) are to be computed for several storm simulations, an initial evaluation should be made to determine which structural configuration (intact or failed structure), on average, best represents the most hazardous condition; this configuration should be used in computing the TWLs.

- Causeways, Roads, and Railroads: These obstacles should not be evaluated according to FEMA guidance on levees or coastal armoring structures even though they may act as such in certain instances. During storm surge modeling and the analysis of wave-related effects, these obstacles should generally be left in place as captured in the topographic data and no additional effort should be made to either remove or represent these structures in the modeling setup. If the Mapping Partner has reason to believe that the removal or the explicit representation of such obstacles might best represent hydro-morphologic conditions during storms, the Mapping Partner should consult with the FEMA Project Officer regarding possible removal or representation of these structures.

- Industrial Facilities, Tank Farms, Containment Berms, Perimeter Roads, and Related Structures: These structures should remain in place if captured in the topographic data and no additional effort should be made to represent these structures in the modeling setup unless the Mapping Partner has reason to believe that their explicit representation will best reproduce the hydraulic conditions during storms. If these structures are captured in the topographic data, engineering judgment should be used to ascertain whether their presence unreasonably results in the under-estimation or over-estimation of flood effects, and if the Mapping Partner believes this to be the case, should consult with the FEMA Project Officer regarding possible failure or removal of these structures.

5. Flood Risk Project Treatment of Beach Stabilization Structures

If a Mapping Partner chooses to evaluate beach stabilization structures (e.g., groins, jetties, sills, or similar structures) during Flood Risk Project, the following approach is recommended:

1. Identify any beach stabilization structures during the Flood Risk Project reconnaissance phase.
2. Use historical evidence and engineering judgment to determine whether the structures (or similar structures nearby) have been damaged or detached (during prior storms or gradually over time).
3. Document prior damage to the stabilization structures and any resulting shoreline recession attributable to the structural damage.
4. Notify the FEMA Project Officer if the Mapping Partner intends to remove beach stabilization structures or reduce their effects during the Flood Risk Project analyses. Obtain FEMA concurrence before proceeding with the following steps.
5. Use historical evidence and engineering judgment to predict the likely shoreline configuration (in plain view and elevation) if the structures fail during 1-percent-annual-chance flood conditions.
6. Subject the modified shoreline and profile to typical Flood Risk Project analyses (e.g., event-based erosion analysis, wave runup and overtopping analysis, and wave height analysis).
7. Note that in the case of some stabilization structures, it is unlikely that their failure will require “removal” from analysis transects; the effects of the structure failure on the shoreline configuration, however, should be considered by the analyses.

6. Flood Risk Project Treatment of Miscellaneous Structures

Current FEMA guidance does not address the effects of miscellaneous structures (e.g., piers, port and navigation structures, bridges, culverts, tide gates, etc.) on coastal flood hazard analysis and mapping. This subsection provides general guidance for identifying and analyzing the effects of miscellaneous structures on flooding areas as follows:

- The Mapping Partner may identify structures – in addition to the coastal armoring and beach stabilization structures addressed above – that could exert a significant influence on nearshore waves and currents, coastal sediment transport, or ponding in backshore areas, during 1-percent-annual-chance flood conditions, particularly in sheltered waters. This should be done during the Flood Risk Project reconnaissance phase.
- Once identified, the Mapping Partner may use historical evidence, other readily available data, and engineering judgment to determine whether the miscellaneous structures are likely to

survive the 1-percent-annual-chance flood conditions. If the structures are likely to fail, then they (and their effects on the shoreline and flooding) may be removed from subsequent analyses.

- The Mapping Partner shall notify the FEMA Project Officer as to how he/she intends to address miscellaneous structures and their effects during the Flood Risk Project analyses, and obtain FEMA concurrence before proceeding.

6.1. Piers and Wharves

Piers and wharves are structures extending from the shoreline into the water used for commercial and industrial operations, residential developments, and recreational activities; for the purposes of this guidance document, a pier shall be defined as a structure extending perpendicular to or at an angle to the shoreline and a wharf shall be defined as a structure oriented approximately parallel to the shoreline. The Mapping Partner should review relevant information including navigation charts and aerial photographs to identify piers and wharves within the study area. The Mapping Partner should verify basic structure and facility information with local agencies and communities to determine location and characteristics including its type of support structure: open structures supported on pilings or closed structures supported on fill. Field surveys should be utilized to augment this information, as needed, to confirm collected data and assess the structure's current condition.

Evaluation of coastal hazards at open construction piers and wharves should follow guidance in Section 6.1.2. Closed construction piers and wharves should be captured in delineation of the transect baseline and evaluation of coastal hazards should follow guidance in Section 6.1.3.

6.1.1. STABILITY IN A 1-PERCENT-ANNUAL-CHANCE EVENT

A pier or wharf must be of suitable material and design to be considered in the analysis of coastal flood hazards. Similar to the analysis of coastal armoring structures, engineering judgement may be sufficient to determine 1-percent-annual-chance survivability. However, if a detailed analysis is warranted, structural design should consider the applicable criteria detailed in Section 2.1 to evaluate the stability of the pier's structural support components. In addition, forces acting on the deck should be evaluated, including:

- Hydrostatic load
- Vertical uplift forcing
- Wave slam

Structures identified as insufficient to withstand a 1-percent-annual-chance event should be removed from subsequent coastal analyses unless a suitable partial failure geometry can be established based on research of failed piers and wharves of similar design.

6.1.2. OPEN PIERS AND WHARVES

At open piers and wharves, the dissipative effect of the pilings, substructure, and deck may be accounted for using empirical analysis or a numerical wave model. An empirical analysis should consider wave transmission through the pile openings based on depth, dimension of structures and piles, and water depths. The analysis should be performed at a resolution sufficient to capture major changes in bathymetry and spatial configuration of piles. Numerical modeling approaches should represent the physics of the wave-structure interaction with sufficient resolution to represent the characteristics of the structure.

Special considerations are recommended based on the deck elevation relative to the elevation of the wave envelope.

- For open, pile supported structures where the lowest horizontal structural member is above the crest of the design wave event, dissipation of wave energy propagating beneath the deck may be evaluated for wave-pile interaction. The analysis should evaluate any runup hazards where the SWEL intersects the underlying topography or support structure.

- For open, pile supported structures where the lowest horizontal structural member and/or deck interacts with the wave envelope, wave energy dissipation from piles, deck, and buildings atop the deck may be evaluated as the wave propagates toward the shoreline. At the seaward end and along transverse edges of the structure, wave runup/splash and overtopping should be considered on the deck itself.

- For open, pile supported structures where the SWEL is higher than the deck elevation, wave propagation analysis over the deck should be performed. The analysis should include attenuation from any building atop the pier expected to survive a 1-percent-annual-chance event.

A single pier or wharf in a response-based study may need to consider several of the configurations described above and the associated analyses based on the water level and wave combinations evaluated. For the first two configurations listed above, fixed pier or wharf structures (open piles, substructure, and deck) may interact with shoreward propagating waves to influence wave conditions at the shoreline. The interactive effect of the structure may be accounted for in determination of overland hazard zones.

In the vicinity of a pier or wharf, the area landward of the shoreline should be evaluated for coastal flood hazards using the wave parameters (height and period) propagated under or across the pier or wharf and its support structure. In the event that surge is below the elevation of the top of the deck, the overland analysis should consider any obstruction to wave hazards imposed by the deck itself.

6.1.3. CLOSED CONSTRUCTION PIERS AND WHARVES

Piers or wharves which have a closed substructure should generally be treated as extensions of the shoreline and be included in the coastal analyses. This includes representation of piers and wharves in storm surge and offshore wave modeling, as allowed by model resolution. Determination of

coastal Base Flood Elevations (BFEs) should follow standard overland wave analysis methods for assessing structural stability, wave propagation, wave runup, and overtopping:

- For closed structures where the deck is above the SWEL, wave runup and overtopping should be evaluated.
- For closed structures where the deck is below the SWEL, overland wave propagation should be evaluated, accounting for any obstructions upon the deck expected to survive a 1-percent-annual-chance event.

The Mapping Partner should position transect(s) to best represent the most hazardous conditions across the pier or wharf. The effects of closed piers and wharves on coastal hazards at adjacent shorelines should also be reflected in the surrounding modeling and mapping.

6.1.4. MAPPING PIERS AND WHARVES

Open construction piers or wharves not evaluated for stability or determined to fail during a 1-percent-annual-chance event should be mapped according to the highest hazard determined along the edge of the pier or wharf. An open pier or wharf can alternately be mapped in Zone D if it is judged stable during a 1-percent-annual-chance event. This alternative should be discussed with the community, as Zone D represents an undetermined flood hazard where purchase of flood insurance is not required.

Closed piers and wharves should be treated as an extension of the shoreline and mapped in accordance with Coastal Floodplain Mapping Guidance, regarding mapping of overland wave hazards including wave propagation, runup, and overtopping. Coastal Floodplain Mapping Guidance is accessible through the FEMA Guidelines and Standards for Flood Risk Analysis and Mapping webpage.

7. Data Requirements

The Mapping Partner shall obtain documentation for each coastal structure that could provide protection during 1-percent-annual-chance flood conditions, or significantly affect flood hazards in the study area. The documentation shall provide all information necessary to evaluate the structure according to the criteria set forth in Section 2.1. Documentation should include, but is not limited to, the following:

- As-built design parameters: structure type, location, layout, dimensions, crest elevation of structure, etc.
- Dominant site particulars (e.g., local water depth, tide, surge and wave conditions, erosion rate, sediment characteristics and geotechnical conditions, debris hazards, and ice climate)
- Construction materials and present integrity

- Historical record for structure including: construction date, plans, and specifications; recent inspection reports and photographs; maintenance plan and responsible party; and dates and descriptions of damage, repairs, and modifications

- Clear indications of effectiveness or ineffectiveness

The Mapping Partner may develop much of this information through office activity, including a careful review of aerial and site photographs, reports and information provided by the community and property owners, and other readily available information. In the case of some major coastal structures, site inspection would be advisable to confirm preliminary judgments.

Note that the level and detail of the structure and site data collected should be consistent with the level of analysis undertaken by the Mapping Partner. An analysis based on engineering judgment, or multiple analyses assuming different structure responses during 1-percent-annual-chance flood conditions (e.g., structure survives intact, partial failure, complete failure) will require less detailed and precise information than a structural engineering and geotechnical evaluation of a coastal structure.

8. Study Documentation

If coastal structures are present in the study area, the Mapping Partner shall document the data, methods, and procedures used to evaluate the likelihood that the structures will survive 1-percent-annual-chance flood conditions. This documentation shall include any assumptions or approximations used in the analyses. The same documentation shall be required in the event that coastal structures are indicated by information collected during the Flood Risk Project, but are apparently buried and not visible during the study.

The Mapping Partner shall document the results of all analyses of coastal structures conducted for the Flood Risk Project. In cases where the Mapping Partner cannot determine whether a given structure would survive the 1-percent-annual-chance flood intact, and where multiple analyses were conducted for the structure (i.e., intact condition, failed condition, and removed from the analysis transect), the Mapping Partner shall document each analysis and record the structure condition that was used to map SFHAs and BFEs.

MT-2 Requests

November 2023

FEMA

This page intentionally left blank (*FEMA Blank Page Note* style)

Requirements for the FEMA Risk Mapping, Assessment, and Planning (Risk MAP) Program are specified separately by statute, regulation, or FEMA policy (primarily the Standards for Flood Risk Analysis and Mapping). This document provides guidance to support the requirements and recommends approaches for effective and efficient implementation. Alternate approaches that comply with all requirements are acceptable.

For more information, please visit the FEMA Guidelines and Standards for Flood Risk Analysis and Mapping webpage (www.fema.gov/guidelines-and-standards-flood-risk-analysis-and-mapping). Copies of the Standards for Flood Risk Analysis and Mapping policy, related guidance, technical references, and other information about the guidelines and standards development process are all available here. You can also search directly by document title at https://www.fema.gov/library.

Table of Revisions

The following summary of changes details revisions to this document subsequent to its most recent version in November 2022.

Affected Section or Subsection	Date	Description
Sections 2.12 and 2.13	Nov. 2023	Minor text updates to align with levee guidance
Section 2.13.1	Nov. 2023	Added new section added titled “National Levee Database”
Section 2.13.2	Nov. 2023	Minor text updates to reference updated modeling along an accredited levee and submittals from other federal agencies
Section 2.13.3	Nov. 2023	Updated Figure 5 – Levee Analysis and Mapping Procedures Workflow

1. Introduction

The purpose of this document is to explain how the Department of Homeland Security, Federal Emergency Management Agency (FEMA) implements the review and processing of requests to revise Flood Insurance Rate Maps (FIRMs) and Flood Insurance Study (FIS) reports (collectively referred to as MT-2 requests). The regulations related to these requests are in Title 44, Chapter 1 of the Code of Federal Regulations (CFR), Parts 60, 65 and 72, available online at www.ecfr.gov/cgi-bin/text-idx?SID=3f8e734915da4dcb349e90ecd70e5931&mc=true&tpl=/ecfrbrowse/Title44/44CIsubchapB.tpl.

This guidance document is intended to supplement the information presented in the MT-2 Instructions which accompany the MT-2 Application Forms. These instructions are referenced at various locations within this document and can be accessed via https://www.fema.gov/flood-maps/change-your-flood-zone/paper-application-forms/mt-2.

1.1. Letter of Map Change Products

This section contains a brief description of FEMA's Letter of Map Change (LOMC) products. The National Flood Insurance Program (NFIP) adopted a baseline probability flood, the base flood, as a standard for floodplain management regulations. The base flood is the flood that has a 1% probability of being equaled or exceeded in any given year (also referred to as the 100-year flood or the 1% annual-chance flood). The Base Flood Elevation (BFE) refers to the height of the base flood, usually in feet in relation to the datum used, or the depth of the base flood, usually in feet above the ground surface. An area subject to inundation by the base flood is identified as a Special Flood Hazard Area (SFHA) on FIRMs.

The BFEs and boundaries of the SFHAs on the FIRMs are determined using the best topographic data available, in combination with hydrologic and hydraulic analyses. Because of limitations of scale or the topographic definition of the source maps used to prepare a community's FIRM, a property may be shown within the SFHA, but be on ground that is above the BFE at the site. In addition, development within a community often occurs that may affect the flood hazard information shown on the FIRM.

The LOMC process was developed to amend or revise the published flood hazard information by letter. The process can be used as frequently as needed to keep the FIRMs up-to-date. FEMA has several types of LOMCs:

- MT-1 (Amendments): Letter of Map Amendment (LOMA), Letter of Map Revision based on Fill (LOMR-F), and Conditional LOMA/LOMR-F.
- MT-2 (Revisions): Letter of Map Revision (LOMR), Conditional LOMR (CLOMR), and Physical Map Revision (PMR).

This guidance document applies specifically to MT-2 requests and the required data necessary for processing them. For information on MT-1 requests, refer to FEMA Guidance Document 65, MT-1 Technical Guidance.

MT-2 revision types are generally described as:

- CLOMR: A letter from FEMA commenting on whether a proposed project, if built as proposed, would meet the minimum NFIP requirements (see 44 CFR Parts 60, 65 and 72). Additionally, a CLOMR may be issued for proposed hydrology-only changes compared to the effective hydrology.
- LOMR: A letter from FEMA officially revising a portion of the effective FIRM to show changes to floodplains, regulatory floodways and/or flood elevations (see 44 CFR Parts 60, 65 and 72). A FIRM is not republished.
- PMR: A republished FIRM panel, with updated FIRM Panel No. and FIRM effective date, incorporating changes to floodplains, regulatory floodways, and/or flood elevations. Because of the increased time and cost involved to change, reprint, and redistribute an NFIP map, compared to a LOMR, a PMR is usually processed when a revision reflects large-scope changes. The republished FIRM will also reflect any effective LOMRs issued within the footprint of the PMR since the FIRM was last published.

1.2. Regulations Applicable to LOMC Processing

The NFIP requires participating communities to adopt floodplain management ordinances containing certain minimum requirements intended to reduce future flood losses. This is a condition of the agreement for making flood insurance available in a community. The NFIP regulations for floodplain management are the minimum criteria a community must adopt for participation in the NFIP. This section describes the portions of Title 44 of the CFR – Emergency Management and Assistance – which are applicable to the LOMC process.

Part 60 of the NFIP regulations provides the floodplain management criteria for floodprone areas. It lays out specific requirements for floodplain management regulations, which are legally enforceable and applied uniformly across the community. These regulations take precedence over any less restrictive conflicting local laws, ordinances or codes. Section 60.3 applies specifically to a community's level of ordinances for floodprone areas. Some states and communities have more restrictive regulations that take precedence over the minimum NFIP requirements of 44 CFR 60.3. These are referred to as higher standards.

Part 65 of the NFIP regulations relates directly to identifying and mapping SFHAs. It outlines the steps a community needs to take to assist in FEMA's effort to identify and publish up-to-date SFHAs. More specifically, 44 CFR 65 provides the procedures and engineering data requirements for identifying and revising flood hazard mapping information. In general, two types of approaches (detailed and approximate) have been used to prepare the FIRM. Approximate methods are typically used to delineate a community's Zone A boundaries (where no BFEs are shown) for participation in

the NFIP. FISs are subsequently prepared for most communities that participate in the regular phase of the NFIP. FISs are based on detailed hydrologic and hydraulic analyses to develop BFEs, flood hazard areas, and floodways for developed communities.

At any time, communities and property owners have the right to request revisions to the flood hazard areas and other flood information shown on a FIRM and in an FIS report. The data requirements and procedures for revising effective FIRMs and flood hazard information vary according to the community's level of ordinance and the type of effective study performed for the affected flooding source. For example, the requirements to revise the FIRM for a community with the ordinance level described in 44 CFR 60.3(d) are more complex than those for a community with the ordinance level described in 44 CFR 60.3(b). The requirements for revising effective FIRMs and flood hazard information are discussed in 44 CFR 65. Application of relevant regulations are described in detail in Chapter 3 of this document.

Procedures for hearings and appeals to protest BFEs are described in 44 CFR 67 and 68. To offset the cost of revising FIRMs and reviewing proposed projects, FEMA established a standard review and processing fee schedule. The specific requirements related to fees are described in detail in 44 CFR 72, and a summary can be found in Chapter 4 of this document.

1.3. MT-2 Requests Based on Scientific and Technical Data

As part of the agreement for making flood insurance available in a community, the NFIP requires the participating community to adopt floodplain management ordinances containing certain requirements intended to reduce future flood losses. These are the minimum criteria a community must adopt for participation in the NFIP. A community is responsible for approving all proposed floodplain development and for ensuring any permits required by federal or state law have been received. State and community officials, based on their knowledge of local conditions and in the interest of public safety, may set higher standards for construction or may limit development in floodplain areas. If the state or community has adopted more restrictive or comprehensive floodplain management criteria, those criteria take precedence over the minimum NFIP requirements.

The community is responsible for ensuring updated flood hazard information is submitted, so FEMA can revise the FIRM as appropriate. This will allow floodplain management requirements to be based on current flood hazard information. Some communities use the floodplain permitting process to determine if a CLOMR and/or LOMR is required for a project.

1.3.1. REQUIREMENTS TO SUBMIT TECHNICAL OR SCIENTIFIC DATA (44 CFR 65.3)

The requirement to submit new technical data to FEMA is specified in 44 CFR 65.3:

> A community's base flood elevations may increase or decrease resulting from physical changes affecting flooding conditions. As soon as practicable, but not later than six months after the date such information becomes available, a community shall notify the Administrator of the changes by submitting technical or scientific data in accordance with this part. Such a submission is necessary so that upon confirmation of those physical changes affecting flooding conditions, risk premium rates and flood plain management requirements will be based upon current data.

This regulation requires communities to submit data to FEMA within six months of completing a project that affects the BFEs, but it does not require a community request a LOMR. FEMA can use this data to either physically update the FIRM or issue a LOMR. Communities must submit this data in accordance with their adopted floodplain management ordinances. FEMA will review the data and will either initiate a revision or save the data for a future FIRM update. To help ensure local floodplain management ordinances are based on existing conditions, FEMA recommends communities submit LOMR requests for all projects within the SFHA that affect the effective BFEs, SFHA and/or floodways. Because BFEs may be published to the tenth of a foot, LOMR requests are recommended for projects resulting in a BFE increase or decrease of 0.1 foot or greater. Generally, for multi-phased projects, FEMA recommends a community require a LOMR request for any phase completed more than six months before the next phase begins. If a CLOMR was issued for an entire project (all phases), LOMRs for each phase should not show an increase in BFE greater than what was previously proposed in the issued CLOMR.

Projects crossing or within the channel of a watercourse are assumed to cause an increase or decrease in BFE unless a hydraulic analysis is performed to demonstrate the project does not result in a change to the BFE. These types of projects include, but are not limited to, bridges, culverts, dams, weirs and channel modifications. LOMR requests should be submitted when these types of projects are within an effective SFHA. This includes when they are along tributaries that may not have an effective hydraulic model but are within the floodplain/backwater of a stream with a detailed study. Because they are based on the effective FIRM, MT-1 (LOMA/CLOMA/LOMR-F/CLOMR-F) requests may not be processed if such projects have occurred, because a LOMR has not revised the effective flood hazard information to reflect existing conditions.

While floodplain encroachment within an SFHA overbank area may not significantly increase the BFE, an effective regulatory floodway encroachment should be submitted as a LOMR request, so BFE impacts can be evaluated through hydrologic and hydraulic analyses. The requirement for hydrologic and hydraulic analyses of any encroachment within the regulatory floodway is described in 44 CFR 60.3(d)(3):

> When the Federal Insurance Administrator has provided a notice of final base flood elevations within Zones A1-30 and/or AE on the community's FIRM and, if appropriate, has designated AO zones, AH zones, A99 zones, and A zones on the community's FIRM, and has provided data from which the community shall designate its regulatory floodway, the community shall… Prohibit encroachments, including fill, new construction, substantial improvements, and other development within the adopted regulatory floodway unless it has been demonstrated through hydrologic and hydraulic analyses performed in accordance with standard engineering practice that the proposed encroachment would not result in any increase in flood levels within the community during the occurrence of the base flood discharge.

Per 44 CFR 65.6(a)(3), revisions cannot be based on the effects of proposed projects or future conditions. LOMRs must be based on existing conditions. FEMA reviews proposed projects through the CLOMR process.

1.3.2. REQUIREMENTS TO SUBMIT A CLOMR (44CFR 65.12)

The NFIP requirement to submit a CLOMR request to FEMA for a proposed project is 44 CFR 65.12(a):

> When a community proposes to permit encroachments upon the flood plain when a regulatory floodway has not been adopted or to permit encroachments upon an adopted regulatory floodway which will cause base flood elevation increases in excess of those permitted under paragraphs (c)(10) or (d)(3) of §60.3 of this subchapter, the community shall apply to the Federal Insurance Administrator for conditional approval of such action prior to permitting the encroachments to occur…

Therefore, unless a community has higher standards than the minimum required under 44 CFR 60.3, a CLOMR is required before a community issues a permit for a project if it meets one of the two criteria listed below.

- A project within a Zone AE floodplain without an effective floodway, which would result in a BFE increase of greater than 1.00 foot, compared to the existing (pre-project) conditions, when considering the cumulative impacts of all other existing and proposed encroachments.
- A project within an effective regulatory floodway that would result in any (0.00 foot) BFE increase.

An issued CLOMR by FEMA does not replace a floodplain development permit. A community is not obligated to approve a floodplain development permit because FEMA has issued a CLOMR. A CLOMR is a letter from FEMA commenting on whether a proposed project, if built as proposed, would meet minimum NFIP standards. The community has a choice to approve or disapprove a project's floodplain permit after receiving an issued CLOMR. A CLOMR request must have all the applicable permits, as required for a LOMR request, verified by the participating NFIP community.

1.3.3. HIGHER STANDARDS

Many communities have higher standards of floodplain management ordinances, which exceed the minimum NFIP requirements of 44 CFR 60.3. Therefore, some communities may require LOMRs or CLOMRs for projects that do not trigger the requirement per the criteria described above. Before a revision is submitted to FEMA for review, all other federal, state and local permits must be obtained. FEMA's review would also default to a state's or a community's minimum standards, and FEMA would use that same criteria in CLOMR/LOMR processing.

1.4. Right to Submit an MT-2 Request

1.4.1. RIGHT TO SUBMIT A LOMR (44 CFR 65.4(A))

Per 44 CFR 65.4(a). the community has the right to submit new non-regulatory technical data:

> A community has a right to request changes to any of the information shown on an effective map that does not impact flood plain or floodway delineations or base flood elevations, such as community boundary changes, labeling, or planimetric details. Such a submission shall include appropriate supporting documentation in accordance with this part and may be submitted at any time.

FEMA accepts community-submitted data related to changes in non-regulatory information (information other than floodplain/floodway delineations or BFEs) such as annexations, de-annexations, or incorporation of new communities. FEMA will typically keep these data on file for incorporation into the next map update for the community, but it occasionally may process a LOMR to incorporate the new data. Also, LOMR requests may include a submittal of non-regulatory data, along with changes to regulatory flood hazard information. In these cases, the non-regulatory data may be incorporated into the revised FIRM panels and FIS attachments.

The community's right to submit new technical data is described in 44 CFR 65.4(b):

> All requests for changes to effective maps, other than those initiated by FEMA, must be made in writing by the Chief Executive Officer of the community (CEO) or an official designated by the CEO. Should the CEO refuse to submit such a request on behalf of another party, FEMA will agree to review it only if written evidence is provided indicating the CEO or designee has been requested to do so.

This requirement is typically fulfilled by submitting MT-2 Form 1, signed by an appropriate official from the community (e.g., floodplain administrator) where the changes are occurring. If the revision affects the regulatory flood hazard information for multiple communities, concurrence is required from each community. Affected communities are determined based on the corporate limits shown on the effective FIRM, unless official documentation from the community is provided to demonstrate that the corporate limits on the FIRM are not accurate. Such documentation should include annexation agreements and/or updated corporate limits maps.

If a community chooses not to concur on an MT-2 request, the requester must provide documentation to FEMA to show the request was submitted to the community for review and approval. A written response from the community should be obtained to explain why they do not concur with the MT-2 request. FEMA will consider the response from the community when processing the MT-2 request.

1.4.2. RIGHT TO SUBMIT A CLOMR (44 CFR 65.8)

The right to request FEMA's review of a proposed project is specified under 44 CFR 65.8:

> A community, or an individual through the community, may request FEMA's comments on whether a proposed project, if built as proposed, would justify a map revision. FEMA's comments will be issued in the form of a letter, termed a Conditional Letter of Map Revision, in accordance with 44 CFR part 72. The data required to support such requests are the same as those required for final revisions under §§65.5, 65.6, and 65.7, except as-built certification is not required. All such requests shall be submitted to the FEMA Headquarters Office in Washington, DC, and shall be accompanied by the appropriate payment, in accordance with 44 CFR part 72.

CLOMR requests may also be submitted to obtain FEMA's comment on proposed new hydrology. This allows communities conducting floodplain studies to receive FEMA's comments on the hydrology before proceeding with the hydraulic analysis phase of the study.

1.5. How to Apply

There are two options for submitting an MT-2 request to FEMA.

1. Submit a request online via the Online LOMC Tool at https://hazards.fema.gov/femaportal/onlinelomc/signin. An actual MT-2 Form 1 is not required when applying online, but all other required forms must be submitted. In addition, the signature page for community concurrence and Professional Engineer certification must be printed, signed and submitted with the application. A signature page must be included for each community impacted by the revision request.
2. Submit a request to the LOMC Clearinghouse or any of the applicable addresses listed on the MT-2 Instructions.

1.6. Review and Processing Fee

Some MT-2 requests meant to improve the flood hazard information shown on the effective FIRM and in the FIS report may be exempt from the review and processing fee, per 44 CFR 72.5, which states the following:

Requesters are exempt from submitting review and processing fees for:

a. Requests for map changes based on mapping or study analysis errors;

b. Requests for map changes based on the effects of natural changes within SFHAs;

c. Requests for a Letter of Map Amendment (LOMA);

d. Requests for map changes based on federally sponsored flood-control projects where 50 percent or more of the project's costs are federally funded;

e. Requests for map changes based on detailed hydrologic and hydraulic studies conducted by Federal, State, or local agencies to replace approximate studies conducted by FEMA and shown on the effective FIRM; and

f. Requests for map changes based on flood hazard information meant to improve upon that shown on the flood map or within the flood study will be exempt from review and processing fees. Improvements to flood maps or studies that partially or wholly incorporate man-made modifications within the special flood hazard area will not be exempt from review and processing fees.

Per these regulations, requests meant to improve the flood hazard information shown on the effective FIRM and FIS report are fee exempt. This includes correcting errors, reflecting natural changes, and incorporating more detailed data (i.e., updated topography) and/or better modeling/analysis methods. However, improvements that partially or wholly incorporate manmade modifications within the SFHA will not be exempt from review and processing fees, unless they fall into one of the two categories below.

1. Per 44 CFR 72.5(d), there is a fee exemption for manmade modifications that are federally sponsored flood-control projects where 50% or more of the project's costs are federally funded. To be eligible for this fee exemption, projects must meet the flood protection system definition per 44 CFR 59.1, which is shown below.

    a. Flood protection system means those physical structural works for which funds have been authorized, appropriated and expended and which have been constructed specifically to modify flooding in order to reduce the extent of the area within a community subject to a "special flood hazard" and the extent of the depths of associated flooding. Such a system typically includes hurricane tidal barriers, dams, reservoirs, levees or dikes. These specialized flood modifying works are those constructed in conformance with sound engineering standards.

2. In accordance with the Homeowner Flood Insurance Affordability Act of 2014 (Public Law 113-89, section 22), a requester is exempt from submitting a review or processing fee for a request for a FIRM change based on a project where: (1) the primary purpose is habitat restoration; and (2) the project is funded in whole or in part with federal or state funds. This exemption includes projects to remove a dam, redesign or install a culvert, or install fish passage. For the purposes of this exemption, the meaning of "habitat restoration" is the same as defined in the Partners for Fish and Wildlife Act, 16 USC § 3772 (5):

> The term "habitat restoration" includes:
>
> (2) an activity conducted to return a project site, to the maximum extent practicable, to the ecological condition that existed prior to the loss or degradation, including—
>
> a. removing tile drains or plugging drainage ditches in former or degraded wetland;
>
> b. returning meanders and sustainable profiles to straightened streams;
>
> c. burning grass communities heavily invaded by exotic species to reestablish native grass and plant communities; and
>
> d. planting plant communities that are native to the project site;
>
> (3) if restoration of a project site to its original ecological condition is not practicable, an activity that repairs 1 or more of the original habitat functions and that involves the use of native vegetation, including—
>
> a. the installation of a water control structure in a swale on land isolated from overbank flooding by a major levee to simulate natural hydrological processes; and
>
> b. the placement of streambank or instream habitat diversity structures in streams that cannot be restored to original conditions or profile; and
>
> c. removal of a disturbing or degrading element to enable the native habitat to reestablish or become fully functional.

Requests that incorporate manmade modifications and are not eligible for either of these two fee exemptions shall require the review and processing fee, regardless of project ownership or completion date.

If requesters believe their online case submittals are fee exempt and the system will not set up cases without fees, the requester may choose any fee exemption type and it may be corrected later. However, any required fees not submitted with the initial application must be submitted through the LOMC Clearinghouse and cannot be paid online.

2. MT-2 Supporting Data Requirements

The MT-2 instructions offer a MT-2 Revision Request Submittal Checklist, which is an overview of the required items. Requesters can use that checklist as a reference, but this section provides additional details on the requirements for these items. Generally, MT-2 submittals must be based on the best available data, such as the latest topography and land use information, so the revised flood hazard information reflects existing conditions.

2.1. Narrative

A written description should be submitted describing the request (i.e., the basis of the map change), the scope of the proposed/as-built project, and the method used to analyze the project's effects, as

required per 44 CFR 65.6. A narrative is helpful to give FEMA an overall understanding of the submittal and is encouraged in the MT-2 Instructions.

2.2. MT-2 Application Forms

All forms applicable to the request must be completed and submitted with the application package. This package, which covers various types of revisions, includes six forms, a payment form, plus information about Endangered Species Act of 1973 (ESA) compliance documentation. Only the forms applicable to the request need to be submitted. To access the forms and detailed instructions on selecting and completing the appropriate forms, please refer to https://www.fema.gov/flood-maps/change-your-flood-zone/lomr-clomr?web=1&wdLOR=c4A5173B9-A6F9-4885-8A38-168CC3DFBCFE:

- Form 1, entitled "Overview & Concurrence Form:" Ensure this form is signed by the requester, the certifying engineer, and each community affected by the revision. For online applications, the signature page for community concurrence may be submitted in place of Form 1 (see 1.5.1)

  Community Concurrence:

  - It is common for MT-2 requests to affect multiple communities. Any community that would receive changes to the delineations of the effective floodway or floodplain, or changes to the effective BFEs as a result of the revision, is considered an affected community.

  - Affected communities are identified based on the corporate limits shown on the effective FIRM panel(s), unless the requester demonstrates that these are not accurate. This can be demonstrated by submitting an official corporate limits map from the community.

  - MT-2 applicants must provide all impacted communities with a copy of the MT-2 application package for their review and signature of concurrence. Ideally, this should be done before submitting the request to FEMA. Per 44 CFR 65.4(b), if a community refuses to provide concurrence by signing the MT-2 form, FEMA will still review the request if written evidence indicates that the community's Chief Executive Official (CEO) or designee was asked to do so. The community should provide a written explanation for why they chose not to sign the form. If, in this explanation, a community expresses that they have no objection to the CLOMR or LOMR, this will suffice for community concurrence. If a community voices concerns with the CLOMR or LOMR, FEMA will consider those comments during processing.

  - Flood hazard information for communities not participating in the NFIP may be revised by a LOMR. However, non-participating communities are not required to provide concurrence. LOMRs impacting non-participating communities will become effective 6 months after issuance, to give the non-participating community time to join the NFIP and adopt the new FIRMs.

- Form 2, entitled "Riverine Hydrology and Hydraulics Form"

- Form 3, entitled “Riverine Structures Form”
- Form 4, entitled “Coastal Analysis Form”
- Form 5, entitled “Coastal Structures Form”
- Form 6, entitled “Alluvial Fan Flooding Form”

2.3. State Approval

Some states must approve an MT-2 request before FEMA issues a determination. If an MT-2 request is received without state approval in a state that requires it, FEMA will request the state approval along with any other necessary data/documentation needed for MT-2 processing. At this time, approval is required for MT-2 processing from the following states:

- Illinois – Approval is required for a LOMR that will add a floodway, with no previously issued CLOMR. Approval is required for a CLOMR in which a floodway is added. Notification is required for a LOMR involving only Zone A or a CLOMR without an effective floodway. Refer to Figure 1 for additional information on approvals in Illinois.

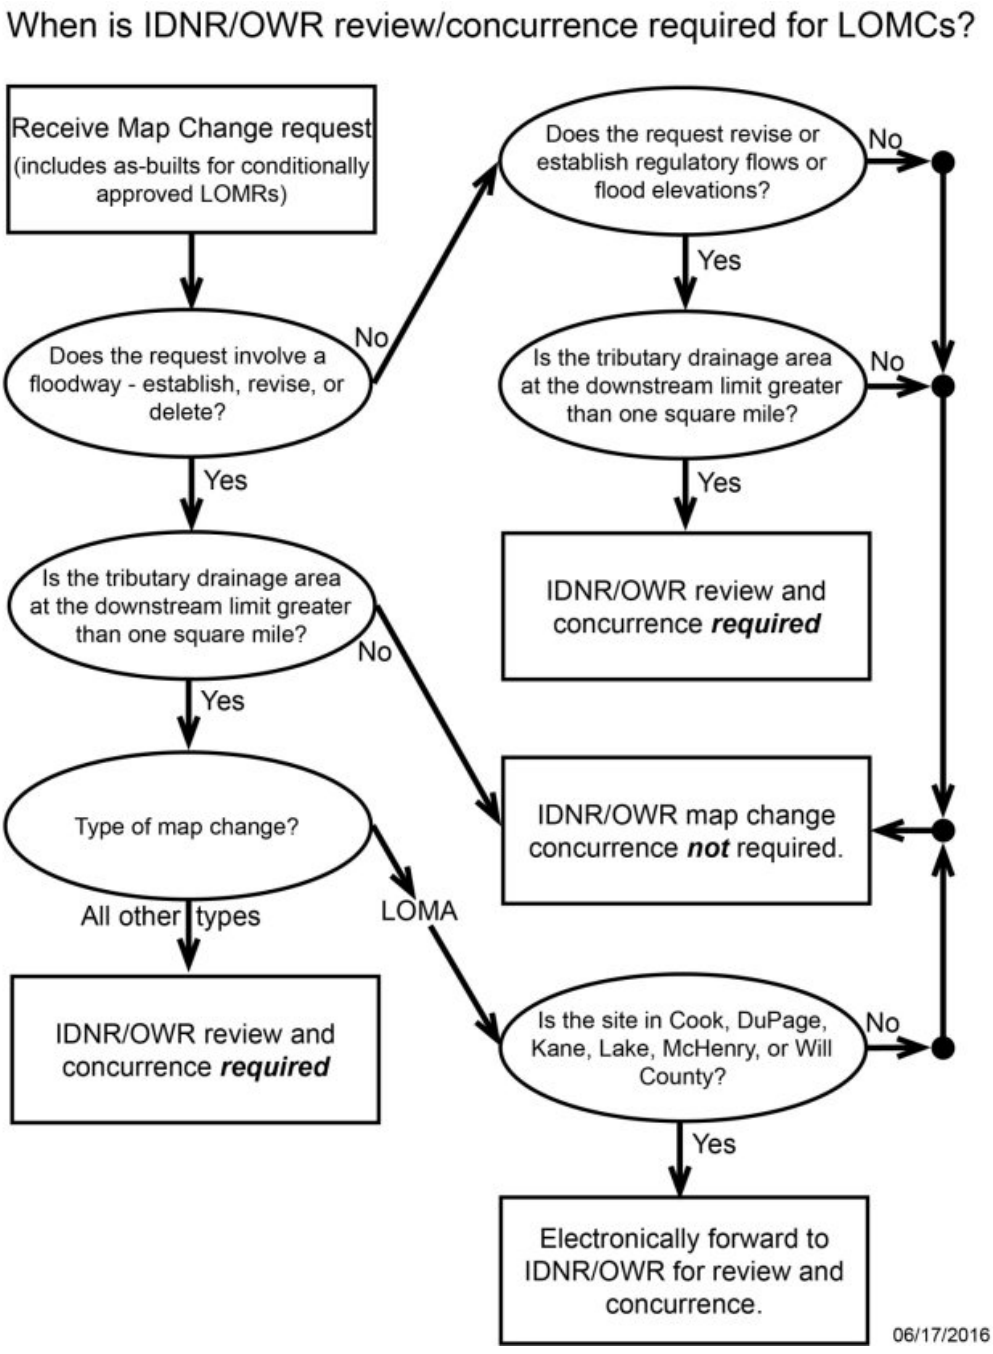

Figure 1. Information on MT-2 State Approval (Illinois)

- Indiana – Approval by the state's Department of Natural Resources (DNR) is required for all LOMRs and CLOMRs. If a project scope changes during the processing of the request, the requester will need to have the state re-approve the project. Any hydrologic and/or hydraulic revision due to a FEMA review requires an amended DNR approval.

- Michigan – Approval is required for a LOMR or CLOMR with a drainfeage area greater than 2 square miles. Approval can be in the form of a permit or letter from Michigan's Department of Environment, Great Lakes, and Energy.

- Minnesota – Approval is required for a LOMR or CLOMR revising the floodway and/or effective hydrology, and for any request involving any part of 44 CFR Part 65 of the NFIP regulations. Approval is not required for any LOMR following a CLOMR where the project was built as proposed, as long as the state approved the CLOMR. Projects revising the hydrology in a detailed study area will be subject to review by Minnesota's Interagency Hydrology Review Committee, which consists of the following members: MNDNR; U.S. Army Corps of Engineers (USACE); U.S. Geological Survey (USGS); Natural Resources Conservation Service; and National Weather Service.

- Wisconsin – Approval is required for all LOMRs and CLOMRs. If a project scope changes during the processing of the request, the requester must ask the state to re-approve the project. Any hydrologic and/or hydraulic revision due to a FEMA review requires an amended DNR approval.

2.4. Hydrologic Analysis

Generally, hydrologic models were not available for many effective Zone As. However, more recent Zone A floodplains are based on models, which can be obtained from FEMA and should be used as the starting point for CLOMRs and LOMRs.

MT-2 requests require a new hydrologic analysis if there are no effective flows available for the flooding source(s) being revised or if the effective flows are no longer reasonable. It is generally up to the certifying engineer to determine if the effective flows are sufficiently accurate or if the effective hydrology must be revised. In general, a revised (or new) hydrologic analysis for a revision request may be conducted for any of the following reasons:

- To reflect longer periods of gaging records of hydrologic data.

- To reflect changed (natural or manmade) physical conditions of the watershed and/or the stream.

- To use improved hydrologic methods.

- To correct an error in the hydrologic analysis performed for the effective study.

- To revise an effective Zone A SFHA where no hydrologic analysis is available.

The following items should be considered when determining if revised hydrology is warranted and which hydrologic method to use.

a. The hydrology should be revised using a method that is at least as detailed as the method used for the effective hydrologic analysis. For example, rainfall runoff

modeling is considered to be more detailed than regression equations. Therefore, if the effective hydrology is based on a rainfall runoff model, the revised flows should not be based solely on the results of regression equations.

b. If a revision uses a hydrologic model or method different from that used for the effective study, the discharges resulting from the new or revised analysis should show a statistically significant difference from the effective discharges. Statistical significance is defined in Section 6.0 of the Guidance for Flood Risk Analysis and Mapping: General Hydrologic Considerations, which may be downloaded from the "Guidance" page on the FEMA website at https://www.fema.gov/flood-maps/guidance-reports/guidelines-standards/guidance-femas-risk-mapping-assessment-and-planning. Generally, if the revised hydrology does not change the computed BFEs by at least 0.5 foot, then the effective flows should be used.

c. Submittals involving revised hydrology must include back-up documentation to support all of the analysis input parameters including, but not necessarily limited to, a drainage area map. Supporting Geographic Information System (GIS) files and a Digital Elevation Model should be submitted when available. Drainage area maps should include the following information:

- Topographic contours (with elevation labels) covering the entire watershed being studied.
- Delineation of all the sub-basins included in the hydrologic analysis, with the sub-basin labels using the same nomenclature as the model.
- Flow paths used for time of concentration calculations (if applicable).
- Locations of discharge calculation points.
- Scale of the map, north arrow, author and date.
- Certification by a Professional Engineer or Surveyor.

d. If a revision affects only a portion of a detailed-study stream, a logical transition between the revised and unrevised flows is preferred. Generally, the revised discharges should not result in lower flow rates for downstream areas than the upstream effective flows or higher flow rates for upstream areas than the downstream effective flows. MT-2 requesters are expected to make a reasonable effort to achieve this logical transition, which may require extending the revised reach significantly upstream or downstream. However, it may not be feasible to achieve this logical transition in some situations. FEMA may accept a discontinuity on a case-by-case basis.

e. Use the flows computed in the hydrologic analysis as inputs to the revised hydraulic model. Generally, the flow rates computed at the basin outlets are used in the hydraulic model for the entire reach flowing through that basin. It may be reasonable to interpolate flows between nodes of the hydrologic model if the sub-basins have a uniform land use and slope. Interpolation should be based on drainage area, with the areas delineated on the drainage area map.

The following methods may be used for the new hydrologic analysis:

- Statistical Analysis of Gage Records.
- Precipitation/Runoff Model.
- Regional Regression Equations.

The requirements for each of these methods are briefly described in the following sections. Please refer to FEMA Guidance Document 71, General Hydrologic Considerations for more information on hydrologic analysis requirements.

2.4.1. STATISTICAL ANALYSES OF GAGE RECORDS

Bulletin 17C, Guidelines for Determining Flood Frequency, is the recommended approach for analyzing gage records. Bulletin 17C can be downloaded from the Subcommittee on Hydrology of the Advisory Committee on Water Information website at https://acwi.gov/hydrology/Frequency/b17c/.

2.4.2. PRECIPITATION / RUNOFF MODEL

A FEMA-acceptable hydrologic analysis must be submitted in digital format. A list of FEMA-acceptable models can be accessed at http://www.fema.gov/flood-maps/products-tools/numerical-models/hydrologic.

The submittal must also include back-up documentation, including the following, to support all model input parameters:

- Drainage area maps.
- Land use and soils maps.
- Calculations used to determine parameters such as lag time, curve number and loss values.
- Source of rainfall data, including temporal distributions, areal reduction factors, etc.
- Unit hydrograph method and associated documentation.
- Survey or as-built documentation for controls of stormwater storage facilities included in the analysis.
- Routing method and associated documentation.

Where possible, the model must be calibrated, and the process fully documented. The procedure should be clearly described in the CLOMR/LOMR narrative. This should include dates, measurements and locations of measurements of historic storms; the parameters revised and the rationale for revising; and input and output data for the calibrated model.

For areas with an effective hydrologic analysis, a revised hydrologic analysis must include an evaluation of the same recurrence interval(s) studied in the effective FIS, such as the base (1% annual-chance) flood and the 10% (10-year), 2% (50-year), and 0.2% (500-year) floods.

If the revision is based on revised hydrology, hydrologic analyses for both pre-project and post-project conditions should be submitted.

For additional guidance related to precipitation/runoff modeling, please refer to FEMA Guidance Document 91, Hydrology: Rainfall-Runoff Analysis.

2.4.3. REGIONAL REGRESSION EQUATIONS

USGS regression equations are available nationwide and recommended for use. A summary of regional regression equation publications for each state can be found at https://water.usgs.gov/osw/programs/nss/pubs.html. If the most recent USGS regression equations were not used, explain why these equations do not apply. Include documentation to support all the input parameters for the regression equations. This typically includes at least a drainage area map.

2.5. Hydraulic Analysis

2.5.1. REQUIREMENTS TO SUBMIT A HYDRAULIC ANALYSIS

Most LOMR and CLOMR requests require a revised hydraulic analysis. However, an MT-2 request may be processed without a new hydraulic analysis in the following situations.

1. The published regulatory flood hazard information (BFEs, SFHA, floodway) does not accurately reflect the results of the effective hydraulic model. In this situation, the FIRM and or FIS report may be updated to match the effective modeling without a new hydraulic analysis.
2. If a LOMR is requested to redelineate the SFHA based on better topographic data than that used to delineate the effective SFHA, FEMA will process the request if it meets both of the following conditions.
    a. No manmade modification within the vicinity of the project may change the BFEs, including fill, excavation, channel modification, or a new or replaced bridge/culvert, dams, weirs, basins or levees. Any of these modifications within the SFHA may affect the BFEs, unless they occur entirely within an area with clearly ineffective flow that is not used for flood storage.
    b. The area being redelineated is relatively small and site specific or, if a significant reach is to be redelineated, the reach is currently categorized as “Valid” under FEMA’s Coordinated Needs Management Strategy (CNMS). For additional information on CNMS, refer to FEMA’s Coordinated Needs Management Strategy (CNMS) Technical Reference CNMS Database User’s Guide, dated November 2019.

3. The area being revised is a stillwater area where a hydrologic analysis accounting for the storage and routing of the full hydrograph is used to determine the BFE(s), such as the analysis of reservoirs and stormwater storage facilities.
4. A hydrology-only CLOMR request may be submitted if a community would like FEMA to review and comment on the new hydrology compared to the effective before they proceed with the hydraulic analysis. Hydrology-only CLOMRs are typically submitted for larger revisions, such as new watershed studies conducted by a community.

A watercourse may have an effective SFHA due to backwater from a downstream flooding source. Although there may not be an effective model for the tributary, a hydraulic model is required to revise the SFHA for the tributary if any manmade modifications have occurred within the SFHA that cross or are within the channel of the tributary. This includes, but is not necessarily limited to, new or replaced bridges/culverts, dams, weirs and channel modifications.

2.5.2. HYDRAULIC CONDITIONS TO BE ANALYZED

Per 44 CFR 65.6(a)(8), unless the basis of the request is using an alternative hydraulic method, or unless the requester can demonstrate that the data of the original hydraulic computer model is unavailable or its use is inappropriate, the analysis must use the same hydraulic computer model used to develop the BFEs shown on the effective FIRM. The model must be updated to show present conditions in the floodplain. Therefore, it is best to request approval from FEMA before submitting an MT-2 request that is not based on the effective hydraulic model.

When a request involves a hydraulic analysis for riverine flooding that differs from the one used to develop the effective FIRM, submit a FEMA-acceptable hydraulic analysis in digital format. Information on FEMA-acceptable models can be accessed at https://www.fema.gov/flood-maps/products-tools/numerical-models/hydraulic.

The following conditions models, as applicable, must be submitted, as explained on Page 16 of the MT-2 Instructions.

- **Duplicate Effective Model:** The duplicate effective model is a copy of the hydraulic analysis used in the effective FIS, referred to as the effective model. The effective model should be reproduced on the requester's equipment to produce the duplicate effective model. This is required to ensure the effective model's input data have been transferred correctly to the requester's equipment. It also ensures the revised data will be integrated into the effective data to provide a continuous FIS model, upstream and downstream of the revised reach. For information on how to obtain copies of the effective FIS models, please visit the FEMA website at https://www.fema.gov/sites/default/files/documents/fema_flood-insurance-study-data-request-form.pdf.

  A duplicate effective model is required for all LOMRs where there is an effective model, even if it is not being used as a basis for the revised modeling, but so it can be compared to the revised modeling. If the effective model is being updated to produce the revised conditions modeling, run the revised conditions modeling using the same model version as the effective, unless the

entire modeled reach is being revised. This is to avoid discrepancies outside of the revised reach that may result from running the model in a different version.

If an effective HEC-2 model is converted to the Hydrologic Engineering Center River Analysis System (HEC-RAS), this is considered a duplicate effective model.

If the effective model is not available from FEMA, the requester should check to see if it is available from the community or any other agency involved with floodplain management in the area of interest. If the effective model is not available, or is available only in PDF format, then a duplicate effective model may not be required. Refer to the flow chart in Figure 2 to determine if a duplicate effective model is required and if the modeling should be truncated. If the entire reach is being revised, it is not necessary to use the duplicate effective model as a base model, but it should be used as a reference for cross section placement and BFE comparisons. Communication from the FEMA Engineering Library should be included with the MT-2 submittal to document that the effective model was requested, but is not available.

- **Corrected Effective Model:** The corrected effective model is the model that corrects any errors in the duplicate effective model, adds any additional cross sections to the duplicate effective model, or incorporates more detailed topographic information used in the effective model. The corrected effective model must not reflect any manmade physical changes that have occurred since the date of the effective published study. Generally, the updated topography should reflect the physical conditions of the area on the date of the FIRM that incorporated the effective modeling. Physical changes in the hydraulic condition of the stream may have occurred after the date of the effective published study. Sometimes the changes result from natural changes, such as a channel “cut-off” at a bend, which may be included in the corrected effective model. Sometimes these are the result of manmade changes, which should not be included in the corrected effective model. An error could be a technical error in the modeling procedures, or it could be any construction in the floodplain that occurred before the date of the effective model but was not incorporated into it.

- **Pre-Project (Existing) Conditions Model:** The duplicate effective model or corrected effective model is modified to produce the pre-project conditions model. The pre-project model reflects any physical modifications that have occurred within the floodplain since the date of the effective model, but prior to the construction of the project for which the revision is being requested. If no modification has occurred since the date of the effective model, this model would be identical to the corrected effective model or duplicate effective model. The pre-project conditions model may be required to support conclusions about the actual impacts of the project associated with the revised or post-project conditions model or to establish more up-to-date models on which to base the revised or post-project conditions model.

- **Revised or Post-Project Conditions Model:** The pre-project conditions model (or duplicate effective model or corrected effective model, as appropriate) is modified to reflect revised or post-project conditions. This model must incorporate any physical changes to the floodplain that

have occurred since the effective model was produced, as well as the effects of the project. For CLOMR requests, this model must reflect proposed conditions.

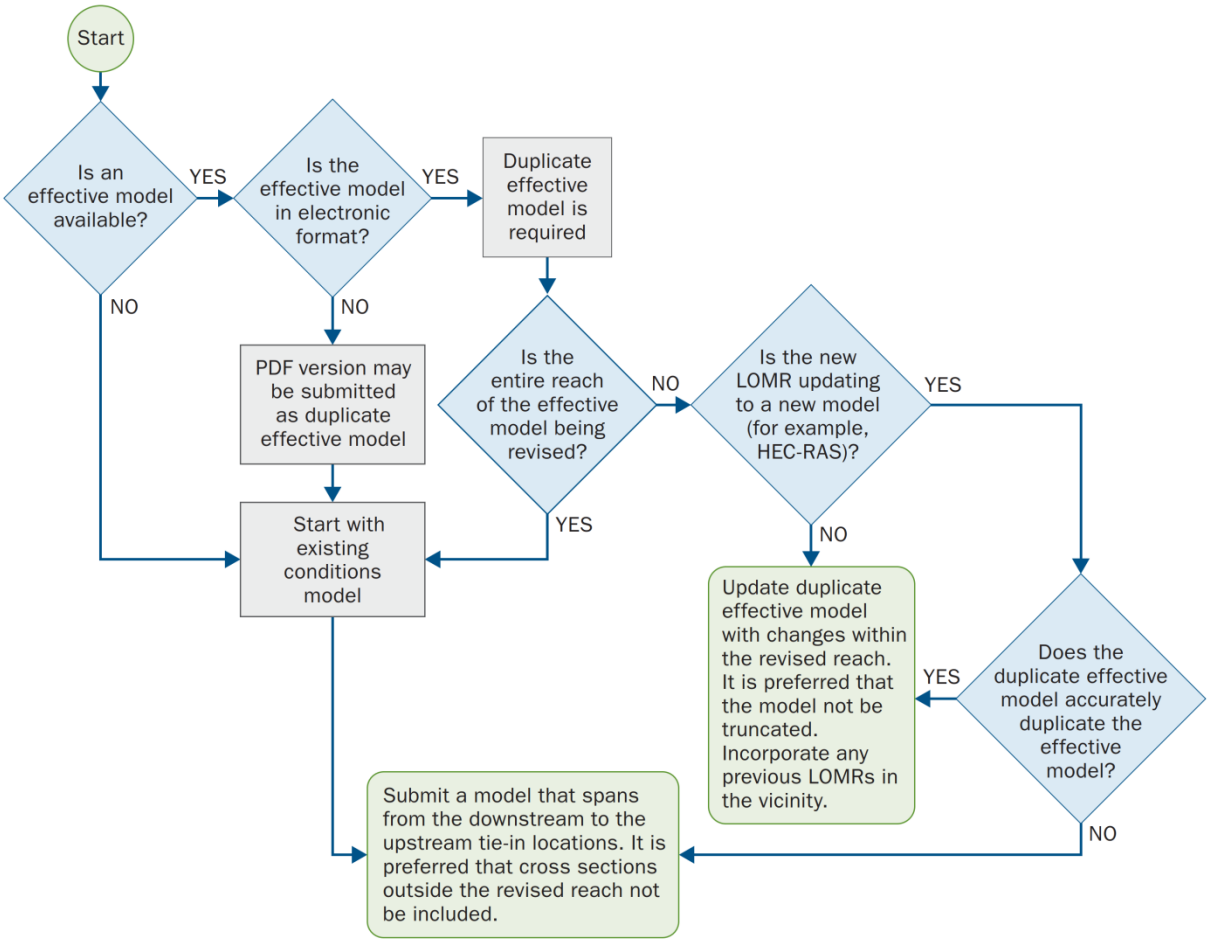

Figure 2. Flow Chart for Determining the Need for a Duplicate Effective Model

The guidelines below should also be followed:

- All submitted models should be clearly named using the nomenclature described above.
- Each model should be described, preferably in the MT-2 report narrative.
- Extraneous models should be omitted from the submission.
- The model version, vertical datum and any other relevant notes should be included in the model, if possible. For HEC-RAS models, this information should be entered in the description field.

2.6. Hydraulic Analysis Criteria

2.6.1. REQUIRED FLOOD FREQUENCIES (44 CFR 65.6(A)(8))

A revised hydraulic analysis for a flooding source with established BFEs must include evaluation of the same recurrence interval(s) studied in the effective model, such as 10-, 50-, 100, and 500-year elevations, and of the floodway.

Boundary Conditions: Typically slope area/normal depth should be used at a confluence for tributaries unless it is demonstrated that the tributary and main stream have coincident peaks. The normal depth method should also be used anywhere a known water-surface elevation is not available. Known water-surface elevations are to be used as the downstream boundary conditions for models starting in the middle of a reach, whenever a reliable source is available. If the reach has effective BFEs, those must be the source of the known water-surface elevation.

BFE "Tie-In" (44 CFR 65.6(a)(2)): Per 65.6(a)(2), unless it is demonstrated that it would not be appropriate, the revised and unrevised BFEs must match within 0.5 foot where such transitions occur within the revision reach. This is determined by comparing the revised or post-project conditions model BFEs to the BFEs from the effective FIS report. Also, post-project BFEs must match pre-project BFEs within 0.1 foot at the limits of revision to ensure that all project impacts are reflected in the revision. Note: the area of revision and the project area may not be the same. If a revised model does not meet tie-in criteria at the project limits, the model must be extended until a tie-in is achieved.

Floodway Analysis: If there is an effective regulatory floodway, the model submitted for each condition listed in Section 2.5.2 should include a baseline conditions model run and a separate floodway model run. Per 44 CFR 65.7(b)(4)(i), the floodway analysis must be performed using the hydraulic computer model used to determine the proposed BFEs.

FEMA recommends using Methods 4 and 1 for modeling the floodway. The floodway surcharge values should be between 0.0 and 1.0. However, some states or communities have maximum surcharge values that are lower than 1.0. For rivers or streams that border two states, one of which has a more restrictive floodway standard, the 1.0 foot surcharge is used unless the states have mutually agreed on a lesser criterion.

In addition, if the modeling is using an effective model and attempting to tie the revised model into the effective model, the model should be run far enough upstream to determine that the surcharge values do not exceed the allowable limit. This can be accomplished by continuing to add effective model cross sections far enough upstream to balance the energy grades in the model between the effective model and the revised model to 0.00-foot tolerance. Once that is achieved, then it is unlikely a surcharge value upstream of this area would exceed the allowable limit.

Refer to FEMA Guidance Document 79, *Floodway Analysis and Mapping*, for more information on floodways.

Additional Model Parameters: Generally, the factors listed below should be considered when developing the hydraulic models to support a CLOMR and/or LOMR, but this list is not exhaustive.

- Whenever feasible, the revised hydraulic model includes cross sections cut/placed at the same profile baseline locations as the cross sections in the effective model to facilitate a comparison of the results.
- Flood discharges used as inputs in the revised hydraulic models correlate with the revised (or effective) hydrologic analysis.
- Roughness Coefficient. The Manning's "n" value is reasonable for the channel and overbank areas in the horizontal and vertical directions.
- Cross sections for bridge/culvert/drop structure modeling are sufficient, reasonably located and consistent with the user's manual recommendations for the software being used.
- Transition Coefficient. Appropriate values are used for the contraction and expansion coefficients along the stream lengths, near structures.
- The loss parameters for the structures are reasonable and consistent with the recommended values for the types of structures in the users' manual for the software being used.
- Bridge modeling approaches and corresponding values are reasonable and consistent with those recommended for the types of structures in the users' manual for the software being used.
- The specifications of the structure in the hydraulic models are verified from as-built plans or a survey for the project.
- The ineffective flow areas are appropriately defined near structures and other applicable locations.
- The selected model satisfies the requirements in the users' manual and the standards of the selected methods.
- The cross sections in the model extend across the entire floodplain to contain the base floodplain and 0.2% annual-chance floodplain, if appropriate.
- The BFEs computed in the baseline conditions model run and the BFEs computed for the floodway model run are consistent.
- The water-surface profiles of different flood frequencies do not cross one another.
- The water-surface profiles do not show drawdowns (i.e., the water-surface elevation at an upstream cross section must be higher than a water-surface elevation at a downstream cross section). However, drawdowns in the vicinity of bridges/culverts may indicate errors in the

hydraulic modeling of the structure; the modeling errors should be corrected or verified as reasonable before profiles are revised.

- Any notes, warnings or errors provided by the modeling program have been examined and addressed where appropriate.

2.7. Coastal Analysis

Flood hazard studies are considered coastal studies when the flooding being evaluated is a combination of elevated water levels, typically due to storm surge, and wave action. Coastal study methodologies are used to evaluate flood hazards along the shorelines of the Atlantic Ocean, Gulf of Mexico, Pacific Ocean and Great Lakes. Bays, tributaries and other lakes are also considered to have coastal floodplains when they are subject to water level and wave hazard processes similar to those on the open coasts. Map revisions may be requested for one or more of the following reasons (note: the list below is not exhaustive):

- To rectify an error in the flood hazard analysis conducted in the effective study or an error in the mapping of the results of the effective study.

- To reflect changes, natural or manmade, in the physical conditions of the coastal transect.

    - Guidance for Flood Risk Analysis and Mapping: Coastal Structures outlines procedures for the treatment of structures and obstacles that are present on the transect but may or may not be engineered to provide flood protection.

    - Any case submitted in an area affected by beach nourishment must appropriately account for the nourishment, according to Guidance for Flood Risk Analysis and Mapping: General Study Considerations.

- To reflect more accurate topographic data: the new topographic data must be certified by a licensed surveyor or registered professional engineer.

- To reflect a different period of record of wave or tide gauge data: frequency analysis of wave heights or storm surge elevations based on a small sample may have a wide variance; requests may seek to update old frequency analyses with new data. The new analysis must be statistically adequate to support the calculation of the base flood.

- To incorporate improved engineering methods: requesters may choose to use more detailed or computationally involved engineering analyses in support of map revision requests. For example, a revision request may be based on wave transformation using two-dimensional spectral wave models instead of the standard parametric fetch-limited wave transformation approaches. Any models used in the engineering analyses must be included in the list of numerical models meeting the minimum requirements of the NFIP. This list may be found at https://www.fema.gov/flood-maps/products-tools/numerical-models/coastal. The use of more advanced models does not guarantee an improvement in the quality or accuracy of the

engineering analysis; the engineer should ascertain the appropriateness of the model chosen for the specific analysis.

- To reflect site-specific analyses and information: on a coastline with complex geometry, the flood hazards at certain locations may not have been precisely represented under the broad brush of a large-scale study. For example, the starting wave heights used in the effective Wave Height Analysis for Flood Insurance Studies (WHAFIS) model may not represent the local wave climate due to wave sheltering. The requester should provide detailed engineering analyses and should meet the standards for coastal engineering practice and the requirements set forth in the various FEMA guidance documents related to coastal analysis and mapping.

FEMA guidance documents related to coastal analysis and mapping include:

- Coastal General Study Considerations
- Coastal Wave Setup
- Determination of Wave Characteristics
- Overland Wave Propagation
- Coastal Erosion
- Coastal Structures
- Coastal Water Levels
- Coastal Floodplain Mapping
- Coastal Statistical Simulation Methods
- Coastal Flood Frequency and Extreme Value Analysis
- Coastal Notation, Acronyms and Glossary of Terms
- Combined Coastal and Riverine Floodplain
- Guidelines for Coastal Flood Hazard Analysis and Mapping for the Pacific Coast of the United States

2.8. Alluvial Fan Flooding Analysis

Alluvial fans are gently sloping, fan-shaped landforms created over time by the deposition of eroded sediment. They are common at the base of mountain ranges in arid and semi-arid regions such as southwestern North America. Alluvial fans, and flooding on alluvial fans, show great diversity because of variations in climate, fan history, rates and styles of tectonism, source area lithology,

vegetation and land use. Acknowledging this diversity, FEMA developed an approach that considers site-specific conditions to identify and map flood hazards on alluvial fans. This approach can be found in FEMA's Guidance for Flood Risk Analysis and Mapping, Alluvial Fans. Figure 3 shows an example of an alluvial fan.

Photo taken by Martin G. Miller (from cover of Journal of Geoscience Education)

Figure 3. Photograph of Alluvial Fan

This section defines and discusses the submittal and processing of alluvial fan cases. MT-2 requests for alluvial fan cases require the following:

- Scientific and engineering knowledge of an alluvial fan and how to identify it.
- Alluvial fan flooding and how to analyze it and determine the SFHA associated with it.
- Knowledge of the applicable NFIP regulations.

Submittal and processing of MT-2 alluvial fan cases requires knowledge of the science of alluvial fans, sediment transport analysis, scour analysis, the use of the Fan program, and two-dimensional hydraulic models.

2.8.1. DEFINITIONS AND GENERAL TERMINOLOGY FOR ALLUVIAL FANS

An alluvial fan is a sedimentary deposit at a topographic break, such as the base of a mountain front, escarpment, or valley side, that is composed of stream flow and/or debris flow/sediments and has the shape of a fan, either fully or partially extended. Section 59.1 of the NFIP regulations defines "Alluvial Fan Flooding" as "flooding occurring on the surface of an alluvial fan or similar landform

which originates at the apex and is characterized by high-velocity flows; active processes of erosion, sediment transport and deposition; and unpredictable flow paths."

Alluvial fan flooding encompasses what is described as active and inactive flooding. Active alluvial fan flooding is characterized by flow path uncertainty, abrupt erosion and deposition, and ultra-hazardous conditions. Inactive alluvial fan flooding is similar in nature to traditional riverine flooding, probably subject to erosion and sediment deposition, but characterized by a relatively stable flow path. An alluvial fan may exhibit both active and inactive fan flooding. Examples and more detailed definitions of active and inactive fan flooding hazards can be found in the previously referenced FEMA guidance document.

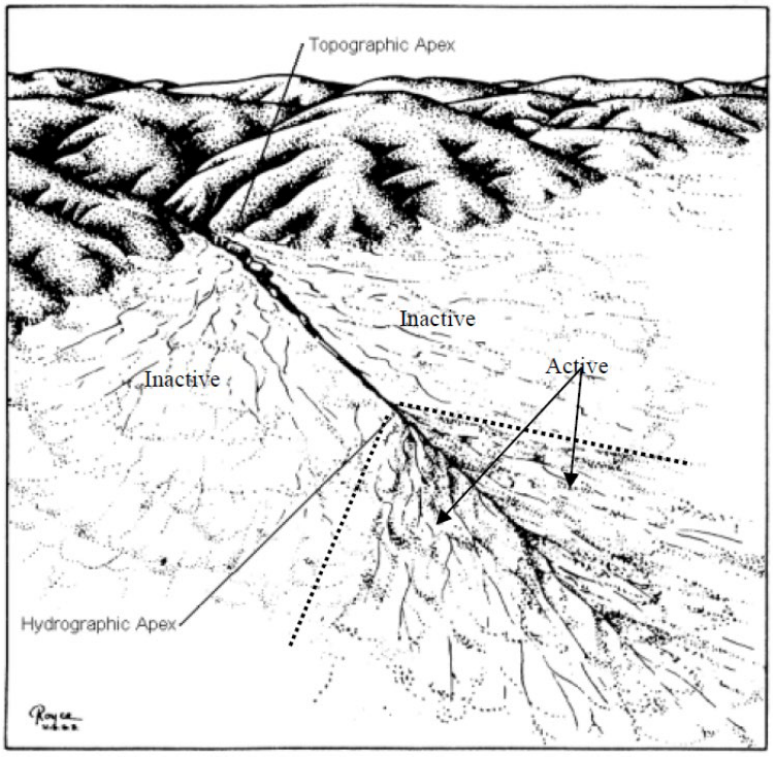

Figure 4. Active and Inactive Alluvial Fan Flow Paths

2.8.2. APPROACHES TO IDENTIFY ALLUVIAL FAN FLOODING

The approach to follow for identifying and mapping alluvial fan flood hazards is discussed in FEMA's Guidance for Flood Risk Analysis and Mapping, Alluvial Fans. This approach divides the analysis into three stages, summarized below.

Stage 1: Recognizing and Characterizing Alluvial Fan Landforms.

At this stage, the scientist or engineer should be able to recognize whether or not a landform is an alluvial fan. This stage will require review of surficial geologic maps, soil maps, topographic maps and aerial photographs. The use of these items will help to identify the type of sedimentary

deposit (alluvium or debris-flow deposits), the shape of the fan, the lateral boundary of the fan and whether the landform is located at a topographic break.

Stage 2: Defining the nature of the alluvial fan environment and identifying active and inactive areas of the fan.

At this stage, the scientist or engineer should be able to identify the active and inactive parts of the fan. This stage will require the use of aerial photographs, topographic and soils maps, surficial geologic maps, historical records and a detailed field investigation.

Stage 3: Defining and Characterizing the Base Flood Within the Defined Areas.

This stage determines the severity and delineates the extent of the base flood within any floodprone area identified in Stage 2 as an active alluvial fan area. Several methods are appropriate for quantifying the base flood; however, not all methods are appropriate for all situations. The methods below are the most commonly used.

Probabilistic Method: This method entails the use of the Fan Program, which is based on the assumption of critical depth and equal probability along contour arcs (random flow paths). Some experts think this method overpredicts the extent of the SFHA.

Geomorphic Method: This method is based on qualitative information such as surficial geologic maps, soil maps, topographic maps, aerial photographs, historical data, post-flood verification, interpretive studies and extensive field surveys. It is frequently used for younger, less-developed soils with deeply incised channels. This method is mainly used for Zone A delineations because it does not involve any computations.

Deterministic Method: This method entails the use of two-dimensional hydraulic models such as HEC-RAS v5.0 or higher. By simulating two dimensional overland flow, the model is able to calculate the flow rate, depth, and velocity in each node of the alluvial fan. In addition, sediment transport analyses are generally required for alluvial fan analysis. Because of the extreme uncertainty associated with the science of sediment transport, it is subject to the reviewer's own judgment. Sediment transport formulas and classifications are shown in Table 2 in FEMA's Guidance for Flood Risk Analysis and Mapping, Alluvial Fans.

Note: When using the Probabilistic or Deterministic Method, the Geomorphic method should always be the basis on which to build the models for both methods.

2.8.3. INITIAL REVIEW AND GENERAL REQUIREMENT

The general CLOMR/LOMR submittal requirements for alluvial fan cases are similar to the riverine submittal requirements. The following additional items are required:

- MT-2 Application/Certification Form 6: Alluvial Fan Flooding.

- MT-2 Application/Certification Form 3: Riverine Structures. This form is required if the request is based on structural control measures such as channelization, levee, floodwall, dams and sedimentation basins.

2.8.4. REVIEW OF ALLUVIAL FAN CLOMR/LOMR SUBMITTALS

The most common type of LOMR/CLOMR request involves revising an effective alluvial fan SFHA depicted on the FIRM as Zone AO, with flood depths and velocities, or Zone A. This type of request nearly always involves structural measures, such as levees, floodwalls, detention/retention basins or channelization. MT-2 requests may also establish a new SFHA along an alluvial fan or revise an effective SFHA along an alluvial fan based on better data. The effective zone designation should be verified by the applicant to confirm whether or not the flooding source is an alluvial fan.

2.8.5. SUBMITTAL FOR AN ESTABLISHED ALLUVIAL FAN SFHA

Most alluvial fan MT-2 requests involve an established alluvial fan SFHA shown on the FIRM. Those cases are based on structural control measures such as channelization, levees, floodwalls, dams and sedimentation basins. Therefore, there is no need for a Stage 1 or 2 analysis; only a Stage 3 analysis, as described in Section 2.7.7, is required.

2.8.6. REQUESTS FOR A SUBMITTAL IN A NEWLY ESTABLISHED ALLUVIAL FAN SFHA OR BETTER DATA

When requests involve newly identified (or suspected) alluvial fan areas, the submittal must include all three stages of analysis. A request to revise an established SFHA based on better data will also require the submittal of all three stages of analysis.

Additional information regarding the three-stage analysis and required documentation can be found in FEMA's Guidance for Flood Risk Analysis and Mapping, Alluvial Fans.

2.8.7. STAGE 3 ANALYSIS

Information regarding the Stage 3 process and requirements can be found in FEMA's Guidance for Flood Risk Analysis and Mapping, Alluvial Fans. At minimum, this analysis should demonstrate the flood control measures will effectively eliminate alluvial fan hazards from the area they protect. The analysis must include the following:

- Assessment of discharge, debris and sediment movement in the entire drainage basin (not only the fan area).

- Engineering analysis showing that the measures will accommodate the peak discharge volumes of water debris and sediment, and will withstand the hydrodynamic and hydrostatic forces.

- Engineering analysis showing potential scour and erosion, and measures for protection against them.

- Engineering analysis showing the measures will provide protection from hazards associated with the possible relocation of flow paths from other parts of the fan.
- Engineering analysis that assesses the effects of the project on flood hazards, including the depth and velocity of floodwaters and scour and sediment deposition, on other areas of the fan.
- An accounting for local drainage (if any).

In addition, the following items must be submitted:

- Certification by a registered professional engineer.
- An operations and maintenance plan (reviewed and accepted by community, state and local agencies that have jurisdiction) for any structure within the alluvial fan.
- Certified as-built plans.

The applicable provisions of Sections 65.2, 65.4, 65.6, 65.8 and 65.10 of the NFIP regulations also apply to MT-2 requests involving alluvial fan flooding, and the appropriate supporting data must be submitted.

2.8.8. MAPPING OF ALLUVIAL FAN SFHA

Where possible, the SFHA for an alluvial fan will be mapped as Zone AO, with a listed depth and velocity. Alluvial fan flood hazard zones with a depth greater than 3 feet should be mapped as Zone AE or Zone A on the FIRM, with a note indicating that the flood zone is an alluvial fan flood zone.

NOTE: Refer to the Regulations for Mapping and Map Revisions for Areas Subject to Alluvial Fan Flooding (44 CFR 65.13).

2.9. Topographic Workmap

A certified topographic workmap of suitable scale, contour interval, and planimetric definition, which is extensive enough to show the entire area covered by the revised or post-project conditions model, must be submitted. The workmap must be submitted in Portable Document Format (PDF) and certified (sealed, signed and dated) by a registered professional engineer. The scale of the map must be sufficient to confirm the accurate delineation of the floodway and floodplain boundaries, and all features must be clearly shown and described via a legend or labels.

The submitted topographic workmap should include the following:

- Boundary delineations of the revised conditions base floodplain and, if applicable, the floodway and 0.2% annual-chance floodplain.
- Boundary delineations of the effective base floodplain and, if applicable, the floodway and 0.2% annual-chance floodplain.

- Graphical tie-in between the revised and effective boundary delineations.
- Topographic contour information used for the floodplain boundary delineations, with elevation labels.
- Vertical datum used on the map (must match the vertical datum of the hydraulic analysis).
- Locations and alignment of all cross sections in the hydraulic modeling within the revised reach.
- Flow line used in the revised hydraulic model.

The floodplain and floodway delineations on the workmap must be consistent with the output from the hydraulic analysis. Therefore, the cross section topwidths and reach lengths shown on the submitted mapping must match the modeling. There may be situations where a discrepancy between the map and model topwidths is warranted (e.g., intermediate high ground and ineffective flow areas), but adequate justification must be provided.

It is strongly recommended that requesters submit workmap source files, such as GIS or Computer-aided design (CAD), along with the PDF. If the effective FIRM for the area of revisions is modernized and includes a FIRM database, then digital (GIS or CAD) data are required. The vertical datum used to reference the topographic elevations must be specified and should be consistent with the datum used to reference the elevations in the hydraulic analysis. The digital data provided should be spatially referenced and cite the projection used (coordinate system, example: Universal Transverse Mercator (UTM)/State Plane) to produce the most accurate mapping possible. If this spatial reference data is not submitted, the workmap will need to be manually georeferenced.

2.10. Annotated FIRM

An annotated FIRM panel (and Flood Boundary and Floodway Map panel, if applicable) must be submitted that shows the revised delineations of the floodplain(s) (and regulatory floodway, if applicable) as delineated on the submitted workmap. The revised boundaries must tie into the effective flood hazard boundaries at the upstream and downstream limits of the area of revision.

2.11. Proposed/As-built Plans

Certified as-built drawings are required for all existing/as-built hydraulic structures that are not included in the effective analysis or are modeled with different geometry than in the effective model. The plans must contain all the details needed to verify the geometry used in the modeling, and the vertical datum must be referenced on all plans. The plans must be certified by a registered professional engineer or surveyor (plans for structures proposed in a CLOMR do not need to be certified, but they must be submitted by a professional engineer). As-built or proposed grading for fill and/or excavation projects must be reflected in the topography shown on the submitted topographic workmap.

2.12. Operation and Maintenance (O&M) Plans

Per 65.6(a)(12), if a community or other party seeks recognition from FEMA on its Flood Hazard Boundary Map or FIRM that an altered or relocated portion of a watercourse provides protection from, or mitigates potential hazards of, the base flood, the Federal Insurance Administrator may request specific documentation from the community describing how and certifying that the flood control structure will be maintained. This documentation, which may be in the form of a written statement from the community CEO, an ordinance, or other legislative action, shall describe the nature of the maintenance activities to be performed, the frequency with which they will be performed, and the title of the local community official responsible for ensuring that the maintenance activities are accomplished.

This documentation is required for LOMRs involving the following structures.

- Accredited levee systems and analysis and mapping procedures for non-accredited levee systems (as appropriate).
- Dams/basins/ponds that are being used to reduce the peak downstream discharges and/or may pose a potential flood risk to adjacent properties.
- Coastal structures being used to reduce the mapped flood hazard.

A draft version of the O&M Plan should be submitted for CLOMRs that are proposing such structures. A final copy will be required after the structure is constructed and a revision to the FIRM is requested.

All maintenance activities must be under the jurisdiction of a federal or state agency, an agency created by federal or state law, or an agency of a community participating in the NFIP that assumes the ultimate responsibility for maintenance. A community may enter into an agreement whereby a private property owner is responsible for the maintenance, but that must be done as part of their own officially adopted maintenance plan. Under the NFIP, FEMA will hold the community responsible for monitoring the maintenance and taking over any maintenance responsibilities that were delegated to a private entity if the entity should default on their agreement with the community. In addition, FEMA will not review the covenant for correctness or liability for the community, only see that the overall O&M plan is sufficient to meet FEMA's requirement.

Per 44 CFR 65.6(a)(13), a community may submit, in lieu of a maintenance plan, certification by a registered professional engineer that the project has been designed to retain its flood-carrying capacity without periodic maintenance.

2.13. Levee-Based MT-2 Requests

Per 44 CFR 59.1, a levee is a manmade structure, usually an earthen embankment, designed and constructed in accordance with sound engineering practices to contain, control or divert the flow of water to reduce flood hazards posed by temporary flooding. A floodwall is a designed structural wall

constructed adjacent to shorelines or stream banks for the purpose of reducing flooding of property on the landward side of the wall. Floodwalls are normally constructed in lieu of or to supplement levees where the land required for levee construction is too expensive or not available. In this document, the term "levee" is used to refer to both earthen embankments and floodwalls.

For the purpose of accrediting levee systems that provide base flood hazard reduction, regulatory and engineering data requirements for processing MT-2 requests through the NFIP have been defined in 44 CFR 65.10. Additional information can be found in FEMA Guidance Document 95: Levees.

Section E of MT-2 Form 3, entitled "Riverine Structures Form," pertains to levees and should be completed in its entirety, in addition to Forms 1 and 2. Section E is comprehensive, and, if filled out properly, will provide an initial overview of the levee system and data requirements.

To facilitate a compliance review, the initial submittal should include, but may not be limited to:

- Detailed hydraulic analyses for both the with-levee and natural valley scenarios.
- Certified topographic work map.
- Levee profile.
- Closure structure Information.
- Certified as-built engineering plans and specifications for the levee system.
- Geotechnical report.
- O&M plan, including emergency preparedness plans.
- Hydrologic and hydraulic analysis of the interior drainage, if applicable.

2.13.1. NATIONAL LEVEE DATABASE

If levee map revisions are requested through the MT-2 Letter of Map Revision (LOMR) process, the appropriate FEMA Regional Project Officer or designee must be provided the necessary data so that the appropriate updates to the levee attributes and alignments can be entered in the National Levee Database (NLD).

2.13.2. LEVEE SYSTEM ACCREDITATION

Regardless of the map change vehicle, LOMR or PMR, all accredited levee systems must comply with 44 CFR 65.10. Generally, the submitted data/documentation must include the following items as applicable but may not be limited to these items. For additional guidance, refer to Chapter 4 of FEMA Guidance Document 95: Levees..

- Design Criteria
  - Freeboard
  - Closures
  - Embankment Protection
  - Embankment and Foundation Stability
  - Settlement
  - Interior Drainage
- Operation Plans
- Emergency Preparedness Plans
- Maintenance Plans
- Certification Requirements

Furthermore, LOMRs including all, or a portion of, accredited levee systems must include documentation of continued compliance with 44 CFR 65.10. Please refer with Section 4.2.5 of FEMA Guidance Document 95: Levees regarding updated modeling along an accredited levee.

There may be instances when other Federal Agencies (such as USACE) may provide information to FEMA in support of a community's request for levee system accreditation. Please refer to Section 4.2.2 of FEMA Guidance Document 95: Levees regarding processing these submittals.

2.13.3. NON-ACCREDITED LEVEE SYSTEMS

Levee systems not mapped as accredited on the effective FIRM must be evaluated "with levee" and using the "natural valley" procedure for the entire system. The landward side of the structure may be mapped based on the results of the natural valley analysis. If desired by the requester, a more refined approach to mapping the flood hazards landward of a levee system, the Levee Analysis and Mapping Process, may be used. As shown in Figure 5, this process should be completed before submitting a CLOMR or LOMR request to FEMA. For more information on non-accredited levee systems and the Levee Analysis and Mapping Process, refer to Chapter 6 of FEMA Guidance Document 95: Levees.

Per FEMA Guidance Document 95: Levees, if a levee system is accredited on the effective FIRM but has insufficient data/documentation to comply with 44 CFR 65.10, then the levee system must be remapped following the analysis and mapping procedures for non-accredited levee systems.

For more guidance on non-accredited levee systems, including non-levee features/reaches, refer to Chapter 6 and 7 of FEMA Guidance Document 95: Levees.

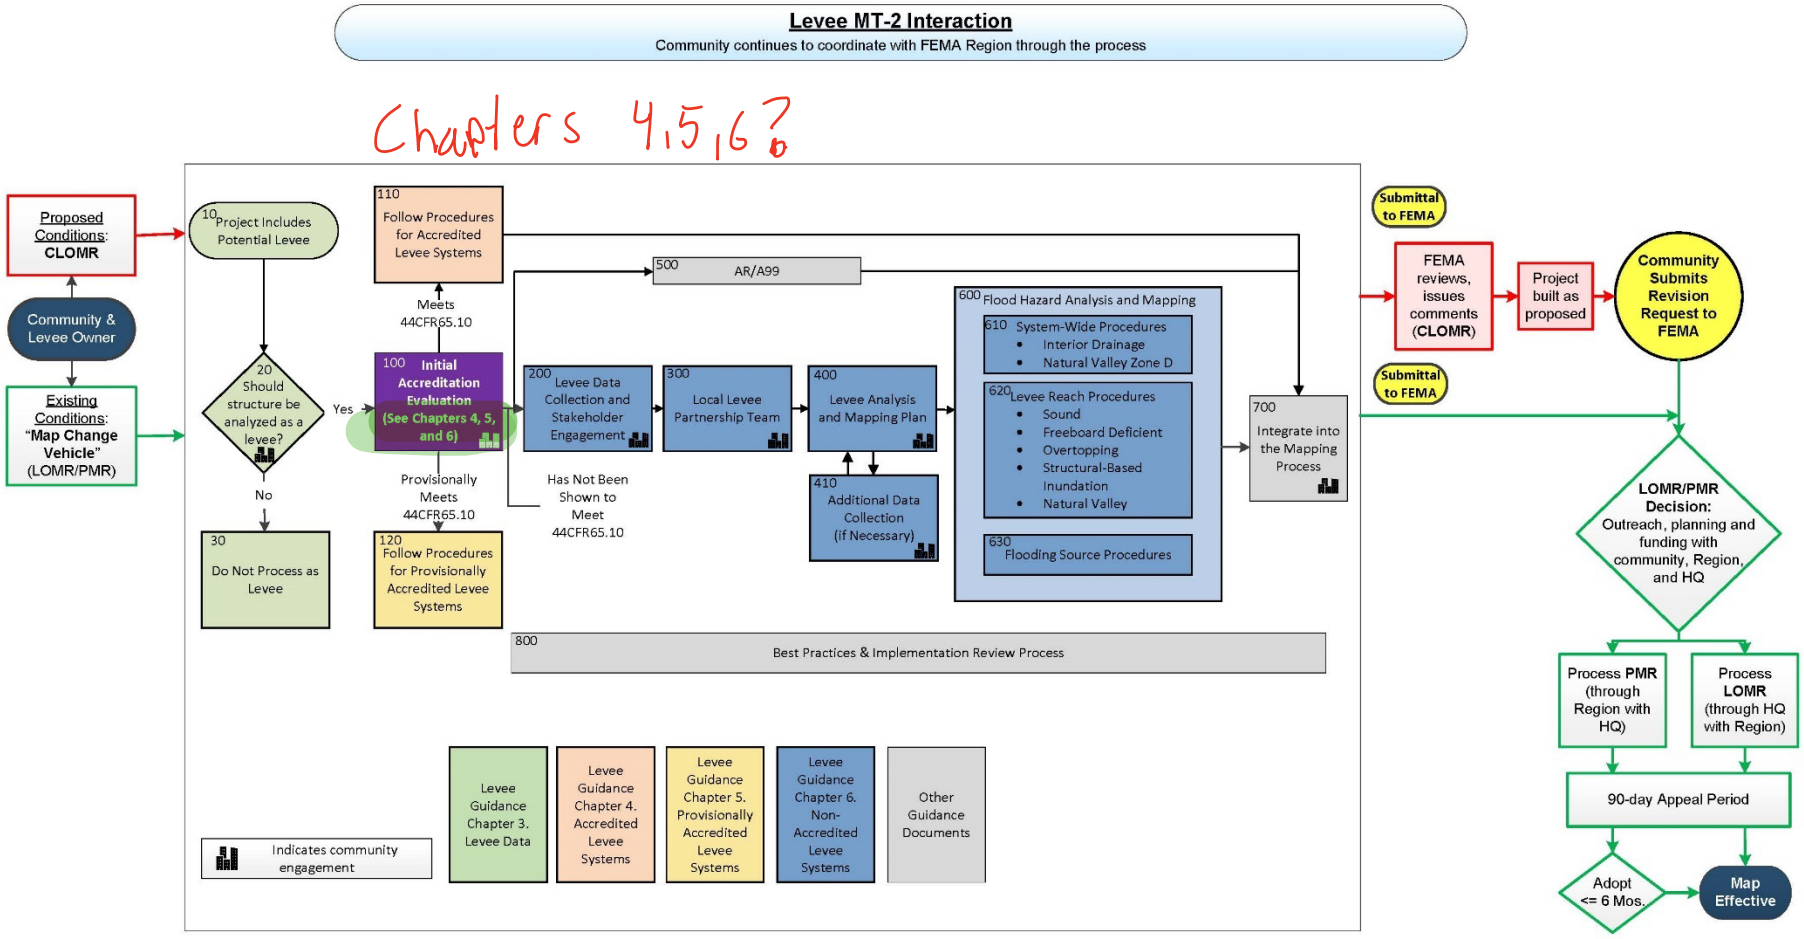

Figure 5. Levee Analysis and Mapping Procedures Workflow

2.14. Property Owner Notification

Notification of the revision is required for a CLOMR and LOMR if any of the following changes will occur as a result of the LOMR.

- Widening/shifting/establishing of the base floodplain such that any property is being added to the SFHA.
- Increases and/or establishment of BFEs.
- Any change in the floodway delineation.

Notification may be achieved either through individual legal notices to affected property owners or via a legal notice published in the local newspaper. Notices must include the extent of revision and contact information for any interested parties.

- Individual Legal Notices: These may take the form of a signed copy of the letter sent along with either a mailing list or certified mailing receipts.
- Newspaper Notice: The newspaper notice should be published in the legal notices section of a prominent local newspaper with circulation throughout the impacted communities. Only one publication date is needed.

According to 44 CFR 65.7, floodway revisions require submitting a copy of the public notice distributed by the community stating its intent to revise the regulatory floodway, or a statement by the community that it has notified all affected property owners and affected adjacent jurisdictions. Therefore, a newspaper notice for a floodway revision must be coordinated by or on behalf of the community. Individual property owner notifications for floodway revisions must either be on community letterhead or the community must provide a written statement to confirm “all affected property owners have been notified of the floodway revision.”

When the floodway is not being revised and all BFE and/or SFHA increases are on property owned by the requester, property owner notification is not required if:

1. The property owner has signed MT-2 Form 1.
2. The certifying engineer confirms in writing all adversely impacted property is owned by the requester.

If the regulatory floodway is being revised, the community must confirm all impacted property owners have been notified of the floodway revision (per 44 CFR 65.7), even if the floodway revision is entirely contained within the requester’s property.

Sample notification templates for various changes to SFHAs, BFEs and regulatory floodways are shown in the MT-2 Forms Instructions (Figures 3 and 4 for LOMRs, and Figures 5 and 6 for CLOMRs).

CLOMRs require notifications if the follow-up LOMR would result in the changes described in this section.

2.15. CLOMR-Only Requirements

2.15.1. 65.12 REGULATORY REQUIREMENTS

If the BFE increases more than 0.00 feet as a result of encroachment within an effective floodway, or more than 1.0 foot within Zone AE in an area without a floodway, between the pre-project (existing) conditions and the proposed conditions as a result of the proposed project, the following must be submitted.

a. Certification no structures are in areas that would be affected by the BFE increase.
    - Structures that are already in the effective floodplain are affected if the BFE at the structure would increase as a result of the proposed project.
    - Structures are affected if their lowest adjacent grade is below the proposed conditions BFE, even if the first-floor elevation is above the BFE.
    - This refers to any BFE increase greater than 0.00 feet. It may be possible for a project to result in small BFE increases in areas outside the revised reach. Therefore, this certification is not limited to areas within the revised reach.
b. Documentation of the individual legal notice sent to all affected property owners, explaining the impact of the proposed action on their property.
c. An evaluation of alternatives that would not result in an increase in BFE.
d. Concurrence of the CEO of any communities affected by the proposed actions.

According to FEMA's policy, a CLOMR for a project in Zone A is subject to meeting the same standards of 65.12 as a project in Zone AE with BFEs and no floodway.

2.15.2. ENDANGERED SPECIES ACT COMPLIANCE

CLOMR applicants are responsible for providing FEMA with documentation that the project has complied with the Endangered Species Act of 1973 (ESA). This must occur before FEMA reviews the CLOMR application.

While FEMA does not play a role in ESA compliance for proposed private development, these projects are required to comply with the ESA independently of FEMA's CLOMR process. For non-federal projects, the requester must document:

1. No potential for "take" exists, meaning the project has no potential to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect (or to attempt to engage in any such conduct) threatened and endangered species. The requester will be responsible for determining the potential for "take." The evaluation must be performed by a qualified professional well-versed in

such assessments. The no potential for "take" determination is not required to come from, or be concurred by, the Services.

2. If the requester determines a "take" will or has a potential to occur, they can consider contacting the Services to discuss potential project revisions to eliminate the "take."

If neither option 1 nor 2 is possible, and the project has the potential to "take" listed species, an Incidental Take Permit may be submitted showing the project is the subject, or is covered by the subject, of the permit.

If federal construction, funding or permitting is involved in a project for which a CLOMR or CLOMR-F has been requested, then the applicant may use that agency's Section 7 consultation to document to FEMA that ESA compliance has been achieved. The ESA documentation may be:

1. A "No Effect" determination made by, or concurred by, the federal agency.
2. A "Not Likely to Adversely Affect" determination with concurrence from the Services.
3. A biological opinion with a "no jeopardy" determination or with accepted reasonable and prudent alternatives.
4. A copy of a federally issued permit with justification the proposed development for which a CLOMR or CLOMR-F is sought is covered by the permit.

For LOMR requests involving floodplain activities that have occurred already, private individuals and local and state jurisdictions are required to comply with the ESA independently of FEMA's process. The community needs to ensure any permits are obtained per the NFIP regulations at 44 CFR 60.3(a)(2).

Additional information about the ESA and these requirements is available in the Guidance for Flood Risk Analysis and Mapping: Documentation of Endangered Species Act Compliance for Conditional Letters of Map Change.

2.16. Other Considerations

2.16.1. PRELIMINARY STUDIES

Revision requesters should check with the community to see if an ongoing study will result in a new FIRM and FIS report for the area to be revised. They should also check the FEMA Map Service Center to see if FEMA has issued preliminary or pending data.

If FEMA has issued preliminary products for an ongoing study, the requester should obtain copies of the new FIRM and FIS report and determine if the flooding source to be revised in the MT-2 request was restudied for the new FIRM and FIS. If the flooding source was not restudied, the effective model will remain effective and can be used for the MT-2 modeling. If the flooding source was restudied during the new FIS, it may be necessary to prepare the MT-2 request using both the preliminary and

effective models. While there are advantages to using preliminary data, it must be done with the understanding the data is subject to change or may be delayed in becoming effective.

LOMRs are not issued to revise preliminary FIRMs. LOMRs must be issued for the effective FIRM panel.

CLOMRs may be based on the effective data, preliminary data, or both. However, even if the modeling for a CLOMR is based on the preliminary study, the effective model must be submitted for comparison purposes. In addition, the effective delineations should be shown on the topographic workmap and the annotated FIRM should be based on the effective FIRM.

2.16.2. PHYSICAL MAP REVISIONS

A PMR occurs when FEMA republishes one or more FIRM panels. This is different from a LOMR, which revises a portion of one or more FIRM panels but does not republish the panel(s). PMRs require a more extensive due process, so the revised FIRM panels and FIS report take longer to become effective. In coordination with the community(-ies), FEMA evaluates LOMR submittals to determine whether a LOMR or a PMR is the best map change vehicle for the specific revision on a case-by-case basis. PMRs are typically more appropriate for revisions that are large, will result in increased flood hazards for many properties, and/or are contentious and have a high risk of being appealed. If a PMR is determined to be the appropriate map change vehicle, FEMA will send a letter to the community and the requester, notifying them that the revision has been converted to a PMR. This letter is sent after FEMA completes the technical review. LOMR requests that are converted to PMRs have the same data requirements as a regular LOMR, except that property owner notifications are not required for the PMR. The time frame for FEMA to process the PMR depends on available funding from the FEMA regional office. Alternatively, the LOMR requester may pay the per-panel PMR processing fee to avoid potential delays from waiting for FEMA funding.

2.16.3. UNSTEADY FLOW AND TWO-DIMENSIONAL MODELING

FEMA flood studies have historically been performed using one-dimensional (1D) hydraulic modeling techniques. Therefore, most effective models are 1D. The effective model must be used as the base model for CLOMRs and LOMRs unless it is not available, or its use is demonstrated to be inappropriate. There are some situations where 1D modeling alone is not capable of accurately representing flood conditions. These include flat terrain with very wide, shallow floodplains; flow through highly urbanized areas; and breakout flow that is hydraulically independent from a main channel/watercourse. In these situations, it may be necessary to employ two-dimensional (2D) modeling, or 2D-informed 1D modeling. If conditions such as these do not exist, then a 1D analysis should be used if it can produce reasonably accurate results. In addition, some software has the functionality to couple 1D and 2D analyses. This should be done if a riverine channel/floodway can be modeled in 1D and overbank areas are more appropriately analyzed in 2D. In highly developed areas with wide overbanks that have an effective detailed 1D model with floodway, there may still be the need for some 2D-informed 1D modeling until adequate resources are available to allow transition to either a 2D, or 1D/2D coupled model.

Floodway regulations are based on the concept of 1D steady-state hydraulic modeling and are difficult to apply to unsteady flow. The floodway analysis must be performed using the same hydraulic computer model used to determine the proposed BFEs. Therefore, if the BFEs are based on an unsteady hydraulic analysis, the floodway must be run on the same unsteady model. The HEC-RAS user manual has guidance for developing 1D unsteady floodway models. Guidance for developing floodways using 2D models is found in FEMA's Floodway Analysis and Mapping Guidance document.

Advanced modeling methods are capable of more accurately simulating complex flooding conditions, but they also come with challenges. MT-2 requests are often intended to revise a small portion of an effective flooding source. When a different model/method is used to analyze the area of interest, there can be difficulties creating a logical transition to the effective flood hazard data at the limits of revision. This may require revising the entire effective reach of the stream. Also, models submitted in support of LOMR requests will become the effective model and must be used for future CLOMR and LOMRs, as well as evaluating the impacts of future development (for example, no-rise analyses). Therefore, when deciding to use a more complex model in support of a CLOMR or LOMR, it is important for communities and requesters to understand the implications it will have on the processing of the individual MT-2 request, data storage and accessibility, future model maintenance and floodplain management activities.

2.16.4. NON-PARTICIPATING COMMUNITIES

FEMA will process CLOMR and/or LOMR requests submitted for areas within the jurisdiction of a community that is not participating in the NFIP. If a community does not participate in the NFIP, it is technically not able to provide the assurances or concurrences required when signing Form 1 of the MT-2 application. However, as explained in Section 1.4.1, FEMA will process a request without the community signature on the application forms, as long as the requester provides documentation to show the request was submitted to the community for review and concurrence. LOMRs impacting non-participating communities will generally become effective 6 months from the issue date, to give the community an opportunity to join the NFIP and adopt the LOMR.

2.16.5. REVISIONS AFFECTING FEDERAL LAND

Projects entirely on federal property or entirely funded and permitted through the federal government are subject to Executive Order (EO) 11988, rather than the regulations of 44 CFR. The federal agency must review their implementation of the EO and act based on their own procedures. However, requests for CLOMRs or LOMRs impacting federal land may be submitted and will be processed based on the criteria described in this Guidance Document. Federal land, such as military bases, may not be within the jurisdiction of an incorporated community or county. Therefore, community concurrence for revisions within these areas is not required.

2.16.6 POTENTIAL VIOLATIONS

While reviewing and processing a CLOMR or LOMR request, FEMA may identify that a community is potentially in violation of NFIP floodplain management regulations as codified in 44 CFR 60.3. If a

previous unresolved or new potential violation is identified, FEMA may suspend its processing of the CLOMR or LOMR until the community remedies all potential violations to the maximum extent possible through coordination with FEMA.

3. MT-2 Request Processing Overview

As explained is Section 1.5, an MT-2 request may be submitted to FEMA either through the Online LOMC Tool or by mailing it to the applicable address. Once a request is received, a case number is assigned, and an automatically generated email is sent to the applicant. Shortly after receipt, the case reviewer will send another acknowledgement email to establish a point of contact for the requester and community.

Per 44 CFR 65.9, within 90 days of receiving an MT-2 request, FEMA will provide the requester and the community either a LOMR, a CLOMR, review comments, or notification that additional time is needed for reviewing/processing the request. Review comments may pertain to any of the MT-2 data requirements described in Section 2.0 of this document. When FEMA provides review comments, the applicant must adequately address all of the comments within 90 days. If they do not, the case will be suspended. Therefore, MT-2 requesters are highly encouraged to discuss the comments with the reviewer prior to submitting the official response to ensure mutual agreement on how to adequately address the comments. Data submittals after a case has been suspended will be treated as original submissions and are subject to all submittal/payment procedures. This also applies if, at any time after the initial request is submitted, the project on which the request is based is altered significantly in design or scope (other than what is needed to respond to comments, concerns or other findings made by FEMA regarding the original submission).

Once FEMA's review is complete and all review comments have been adequately addressed, FEMA will issue a CLOMR or LOMR to the affected communities and provide copies to the requester. The CLOMR/LOMR will generally be issued within 90 days after all review comments have been adequately addressed.

CLOMRs are effective upon issuance and are valid indefinitely. However, if the design of a proposed project changes from what was submitted in an issued CLOMR, it may be necessary to submit an updated CLOMR, particularly if the changes may result in BFE increases greater than the increases proposed in the issued CLOMR. While CLOMRs do not "expire," the follow-up LOMR request may need to update the hydrologic and/or hydraulic analyses submitted with the CLOMR. This would be necessary, for example, if a new flood study becomes effective and the study on which the CLOMR was based is superseded. Another example is the occurrence of significant changes within the floodplain or watershed, where the analysis submitted with the CLOMR no longer represents existing conditions.

LOMRs which result in changes to regulatory flood hazard information (SFHAs, BFEs, and/or floodways) are subject to a statutory 90-day appeal period. FEMA publishes a notice of the appeal period in the local newspaper. This notice is published twice, shortly after the LOMR is issued. The 90-appeal period commences on the date of the second newspaper publication. The notice of appeal

period is also published in the Federal Register and on FEMA's Flood Hazard Determination website (https://www.floodmaps.fema.gov/fhm/bfe_status/bfe_main.asp). LOMRs receiving no valid appeals will typically become effective approximately 4.5 months after issuance (120 days after the second newspaper publication). Valid appeals must be based on scientific and technical data, as explained in FEMA Guidance Document 26, Appeal and Comment Processing, and will be reviewed according to the procedures described in the guidance document. If no valid appeals are received, FEMA will send a notice of final flood hazard determination to the community to confirm the LOMR has become effective as of the effective date on the determination document. If one or more valid appeals are received, the LOMR may be suspended. If appropriate, a revised LOMR incorporating the submitted scientific/technical data will be issued under a new case number.

Figure 6. General Example LOMR Timeline (One Additional Data Submittal)

Guidance for Flood Risk Analysis and Mapping

Hydraulics: Two-Dimensional Analysis

November 2023

FEMA

This page intentionally left blank (*FEMA Blank Page Note* style)

Requirements for the FEMA Risk Mapping, Assessment, and Planning (Risk MAP) Program are specified separately by statute, regulation, or FEMA policy (primarily the Standards for Flood Risk Analysis and Mapping). This document provides guidance to support the requirements and recommends approaches for effective and efficient implementation. Alternate approaches that comply with all requirements are acceptable.

For more information, please visit the FEMA Guidelines and Standards for Flood Risk Analysis and Mapping webpage (www.fema.gov/guidelines-and-standards-flood-risk-analysis-and-mapping). Copies of the Standards for Flood Risk Analysis and Mapping policy, related guidance, technical references, and other information about the guidelines and standards development process are all available here. You can also search directly by document title at https://www.fema.gov/library.

Table of Revisions

The following summary of changes details revisions to this document subsequent to its most recent version in November 2022.

Affected Section or Subsection	***Date***	***Description***
All sections	November 2023	Various minor grammatical updates, including updating references to existing Risk MAP guidance and external resources

1. Introduction

This document discusses two-dimensional (2-D) modeling as it pertains to National Flood Insurance Program (NFIP) regulatory products. NFIP regulatory products are used to determine if a structure is located in a Special Flood Hazard Area (SFHA) and enforce appropriate floodplain management regulations. The 1% annual-chance flood is a regulatory standard for the NFIP. Flood Insurance Rate Maps (FIRMs) are regulatory maps, where the 1% and in some instances 0.2% annual-chance floodplain boundaries are shown. If a flood insurance study includes regulatory floodways, additional information such as average flood velocity and cross-sectional area are provided at some modeled cross sections as well. It is important to note that although some communities might choose to use FIRMs as a flood risk management tool, the main purpose of these maps is still in outlining flood insurance purchase requirements and for floodplain management. Therefore, the most critical information shown on FIRMs are the SFHA delineations and flood elevations associated with the 1% annual-chance discharges in the flooding sources. This document is not a technical manual or reference for 2-D modeling techniques.

The underlying assumption for one-dimensional (1-D) hydraulic modeling is that the conveyances, velocities, and associated physical forces and variations are only significant in the stream direction (i.e., upstream and downstream); those in the lateral directions are negligible in modeling. As a result, the hydraulic parameters can be computed using cross sections placed perpendicular to the flow direction. Two-dimensional (2-D) modeling accounts for the transverse components. 2-D models solve depth-averaged equations of motion using a grid-based finite difference scheme, finite volume method, or apply finite element solution techniques. In a 2-D analysis, hydraulic properties of the floodplain are computed at the grids for the finite difference scheme and at the nodes, for the finite element scheme of solution. The governing equations of a 2-D solution assume that topography of the ground within a grid or element, and hence the water elevation, show mild variations. The hydraulic analysis in the vicinity of control structures is computed using steady flow analysis methods for the range of discharges the structure is likely to experience.

2-D models are most applicable to streams on flat terrain with broad floodplains where flow is moving in two or more directions, or flow is hydraulically disconnected between the main channel and the floodplain.

Physical Map Revision Overview

The objective of the Physical Map Revision (PMR) is to update the regulatory flood hazard data and ensure that the most current and up-to-date flood hazard data, including all new studies and Letters of Map Revision (LOMRs), are incorporated into the National Flood Hazard Layer (NFHL). PMRs are processed by FEMA when a portion of a community's flood hazards need to be revised and updating the full countywide regulatory products is not necessary. As a result, the updated flood hazard data will be used to create revised Flood Insurance Rate Map (FIRM) panels and a PMR FIRM Database.

Outlined in this guidance document is the process that Mapping Partners should follow when preparing and submitting PMRs. The roles and responsible parties for each phase are listed and the

details of each responsibility are listed sequentially. A graphical representation of multiple LOMR scenarios and how to address each of them is provided in Section 3.0. A summary of the PMR scenarios is provided in Section 4.0.

1.1. Background

The vast majority of the hydraulic modeling underlying the special flood hazard areas depicted on Flood Insurance Rate Maps (FIRMs) throughout the nation are steady-state flow, 1-D hydraulic models. However, in recent years, there has been an increasing number of unsteady flow, 1-D and 2-D hydraulic models being prepared to support revisions to the NFIP's special flood hazard areas.

1.2. Appropriate Use of 2-D Model

Steady-state models represent the flood with a constant discharge throughout time, whereas unsteady-state models have the flood wave represented as a function of time in every detail. In 1-D models, the inherent assumption is that the water flow occurs mainly in one direction, whereas in 2-D models two horizontal coordinates are used to represent the flow velocity vectors; the vertical velocity is assumed to be negligible (Cook, 2008). Therefore, from a theoretical point of view, and given that all other conditions are met, an unsteady-state, 2-D model would produce a more realistic prediction of the flooding extent, because more details of the flood wave and flooding patterns can be represented with horizontal resolution. Cook and Merwade (2009) found that it is reasonable to assume that inundation extent could be more accurately predicted using 2-D simulations, as influences of topographic and geometric features are more accurately represented. However, this straightforward approach for modeling floods does not work well in all cases. In general, the simplest model that can solve the problem with accuracy should be the one selected.

The available data used in a flood study can be a major deciding factor in whether to use a 1-D or 2-D model. Naturally, unsteady–state, 1-D and 2-D modeling approaches require both a higher level of input hydrologic data (time series of discharges or hydrographs, possibly at several locations), higher levels of output analysis, and more rigorous model calibration, as opposed to the steady-state counterparts (Hosseinipour et al., 2012). Data availability required to calibrate and validate a model is variable depending on the community where the study is being developed; the data may be absent in many cases and unfortunately most flooding models applied recently lack calibration.

Not having detailed enough terrain data to undertake the modeling effort is a major concern for 2-D models. If the data do not exist, it is not recommended to use a 2-D model because the model effort will not provide improved results over a 1-D representation. The 1-D model is a reasonable choice if the data do not support the 2-D model.

1.2.1. DECISION PROCESS

There are several factors that should be considered when multi-dimensional modeling is considered for flood insurance studies. These factors should go beyond technical aspects of the modeling to ensure that the added value of these models are commensurate with the added cost associated with data and the modeling effort.

Standard Engineering practice should be followed and in general, technical modeling factors to be considered include but are not limited to:

1. Topographic data availability and resolution
2. Cell size and computation time
3. Flooding from multiple sources
4. The prevalence of braided or split flow conditions as well as ineffective flow areas
5. Levees (overtopping and breach) or other lateral hydraulic structures
6. Dams or reservoirs
7. Shallow flooding
8. Hydraulic conditions (supercritical vs. critical)
9. Hydrologic and soil conditions (high infiltration rate, land use etc.)
10. Bridges, channels, culverts etc.
11. Boundary conditions
12. Model stability
13. Calibration
14. Data storage, transfer, and management
15. Steady or unsteady
16. Data uncertainty

Additional factors that may more closely impact the FEMA products that should be considered include:

1. Population density
2. Level of expertise in community
3. Type of effective models up and downstream
4. Communities up and downstream
5. Up and downstream tie-ins
6. Ease of base flood elevation (BFE) and profile extraction
7. Regulatory floodway
8. Ease of reporting and review
9. Ease of reproducing results

10. Ease of maintenance and future map revision
11. Ease of communication to general stakeholders
12. Software licensing and versioning
13. Cost of modeling and maintenance

Considering the technical and FEMA-specific factors, the decision steps can be broken down into three main categories: Technical, Cost, and Programmatic. When deciding whether a 2-D model would be appropriate the following questions should be asked:

A. Technical (qualitative or quantitative assessment):

1. Will a 2-D analysis (as opposed to 1-D analysis) result in more accurate flood elevations on NFIP maps given the conditions on the ground?
2. Can the 2-D model be used for other purposes?
3. Is the best available topographic information sufficient for a 2-D analysis?
4. Can the effective hydrology be used or is a new hydrologic analysis needed?
5. Are there hydraulic structures that need to be surveyed and modeled?
6. Is effective model calibrated? Is there enough data to calibrate a 2-D model?
7. Is a 1-D, 2-D hybrid more appropriate?
8. Do the potential model parameters work with the model limitations? (i.e., Some 2-D models are 1-D in channel and do not handle bridges well, other 2-D models have things built into their codes that make it run smoother but can affect accuracy).

B. Cost (qualitative or quantitative assessment):

1. Does the model need to be purchased and what is the cost to FEMA or the user, ensuring it adheres to requirements set forth in 44 CFR 65.6(a)(6)?
2. What is the cost of data development if needed? (topographic information, calibration data, hydrology, structure information…).
3. Is there a need for new IT equipment or systems and what would be the cost?
4. What level of expertise is needed to perform the modeling and how does it compare to 1-D modeling?
5. Is there additional cost associated with extracting profiles, BFEs or shapefiles from the 2-D model compared to a 1-D model?
6. What is the cost associated with developing a regulatory floodway and how does it compare to a 1-D model?
7. Cost of QC (no check-RAS)?

8. Does the entire area need to be in 2-D or can a small segment be broken out to handle that?

C. Programmatic (qualitative or quantitative assessment):

1. What are the benefits to the community and property owners from a 2-D analysis?
2. How many structures and how many people will be impacted?
3. Does the community support a 2-D analysis?
4. For floodplain management purposes, including floodway as applicable, does the 2-D model offer benefits compared to the effective model?
5. Is the requirement of 44 CFR 65.6(a)(8) met, demonstrating the effective model is no longer appropriate?
    a. 44 CFR 65.6 (a)(8): A revised hydraulic analysis for a flooding source with established base flood elevations must include evaluation of the same recurrence interval(s) studied in the effective FIS, such as the 10-, 50-, 100-, and 500-year flood elevations, and of the floodway. Unless the basis of the request is the use of an alternative hydraulic methodology or the requestor can demonstrate that the data of the original hydraulic computer model is unavailable or its use is inappropriate, the analysis shall be made using the same hydraulic computer model used to develop the base flood elevations shown on the effective Flood Insurance Rate Map and updated to show present conditions in the floodplain. Copies of the input and output data from the original and revised hydraulic analyses shall be submitted.
6. What are the risks associated with using 2-D models in the community?
7. Does the community/CTP have the in-house capability to work with the 2-D model?
8. Will there be challenges with the appeal process?
9. Will there be software licensing challenges for LOMR requesters, the community or CTP?
10. See comments on floodways.

The results of the assessments above could provide the information necessary to make an informed decision that is technically, financially, and programmatically sound. Please note that additional categories or questions can be incorporated into the process.

1.3. Minimum Data Requirements for 2-D Model Use

Data requirements for flood inundation models fall into four groups: 1) topographic data of the channel and floodplain (model bathymetry), 2) time series of flow rates and stage data for model input and output boundary conditions, 3) roughness coefficients for channel and floodplain, and 4) data for model calibration and validation (Mason et al., 2010).

The creation of a 2-D model requires a detailed and accurate terrain model of the study area. The quality of the terrain model is one of the most limiting factors to the accuracy of the model. For more

information about elevation data used in flood studies see the Elevation Guidance document. For significant flow paths within the model a terrain will need to be supplemented with channel and structure surveys to ensure that flow is routed correctly through the floodplain.

Discharge and stage data are another flood model data requirement which help provide the model boundary conditions and will be discussed in Section 4.5 of this document.

Flow across a floodplain is heavily affected by the type of land cover that is present along the grid. To ensure that significant variations in land cover are accounted for in the 2-D model Manning's roughness coefficients should very from cell to cell. Values of Manning's "n" (roughness) can be determined with the help of aerial or satellite imagery, textbooks, guidelines found in manuals, and site inspections (surveying).

2. Model Verification and Maintenance

2.1. Model Verification

When a currently effective model is updated or run within a new version / type of software testing and documentation of variations due to the model code should be made. If changes due to model code cause significant changes in BFE or SFHA results should be discussed with the regional project officer (RPO).

2.2. Model Maintenance

Models must be designed with ease of maintenance in mind and should be created in discrete areas that allow for efficient modification and computation. There are many factors that can affect the efficiency of a model, number of pixels, pixel size, variation of model parameters between pixels, please refer to the models users guide to ensure that the model runs efficiently.

If a project or additional information affect a models parameter at a scale smaller than the effective model start by assessing if the changes modify the existing model inputs. An example would be if fill is placed in an amount that would change the elevation of pixels within the model, or ground cover is changed that would change the roughness values of pixels. If changes which are localized within a given cell do not change the effective parameters and multiple properties / structures are contained within the affected cell an effort should be made to evaluate localized impacts.

When a 2-D model is modified with new inputs, results from changes within the 2-D model need to be provided for the extent where resulting grid and /or cross section elevations tie in within 0.5 foot.

3. Two-Dimensional Hydraulic Analysis Procedures

The choice of hydraulic procedures for the analyses and presentation of flood hazard information is determined during project scoping. The level of effort and the amount of data collected determines whether flood elevations, or only floodplain boundaries, can be shown on the FIRM.

The approach used for the hydraulic analyses can generally be categorized as one of three types: 1-D steady flow, 1-D unsteady flow, and 2-D steady and unsteady flow analyses. The approaches require different level of effort. The following sections present more information about 2-D analysis.

Documentation of 2-D models must include a georeferenced spatial file showing the locations of the stream under study, major flow paths emanating from and adjacent to the study stream, hydraulic structures adjacent to and crossing the stream, and the grid of cells. The location of each cell must be readily ascertained from the spatial file either through labeling or a labeling scheme (e.g., row and column numbers). Model settings and tolerances should be documented also to ensure that rerunning the model will reproduce previous results.

3.1. Topographic Information

2-D models require digital terrain models as input. Peak water-surface elevations are determined at cells, either evenly spaced squares or irregularly spaced geometric elements, composing a grid or mesh (below both will be referred to as a grid). The model grid should be carefully examined to ensure that linear features, such as embankments and ditches that effect the travel of water through the model are accounted for. The grid must cover the entire project area and the derivation or development of the grid must be clearly documented. For more information about elevation data used in flood studies see the Elevation Guidance document.

The Mapping Partner should carefully select cell size, not only considering the accuracy of the topographic data and computational efficiency of the model, but also mapping and floodplain management needs. Too small a cell size not only slows computations, but also creates too many elevation grids, which may not practically be presented on the floodplain map. Too large a cell size either creates flat water-surface elevations over a large area or does not accurately define the flood boundaries. Cell size and orientation are important attributes to ensure that linear features are represented correctly in the grid. Portions of the grid should be further refined as necessary to ensure that these features are not lost within the grid. In spacing the cells, Mapping Partners should maintain gradual changes in elevation from one cell to adjacent cells to avoid numerical instability; they should not use too many cells along a cross section to avoid unnecessary difficulty in maintaining surcharge in the floodway calculation. More details are discussed in the Floodway Analysis and Mapping Guidance document. The Mapping Partner should not size cells specifically to remove certain structures or lots from the floodplain.

3.2. Hydraulic Structures

The effects of hydraulic structures including bridges and culverts are typically input as rating tables at specified cells. The Mapping Partner must document the modeling of each hydraulic structure. That documentation must include a list of each cell associated with the structure and a description of the rating table including the derivation, sources of data, and the information required in the Hydraulic Structures heading under Section 2.2.3, Hydraulics: One-Dimensional Analysis Guidance.

3.3. Non-Conveyance Areas

Because 2-D models simulate flow in all horizontal directions, the modeler does not, in general, have to identify non-conveyance areas in the input data. However, there may be reasons (e.g., cell size) to identify non-conveyance areas through input data.

The modeling technique should be chosen to reflect the natural conditions (topography and roughness) as closely as practical. Artificially removing cells from computation (e.g., removing cells for areas that were not inundated during the calibration event) may be used to reflect natural conditions in model calibration, but this practice should not be used when developing BFEs for mapping. This approach should also not be used for removing a structure from the floodplain or forcing flow toward or away from a particular area. Similarly, the approach of turning off the cells at the edge of the grids to accelerate model computational time should not be used in runs that develop BFEs for mapping.

The Mapping Partner must fully document the reasoning for, location of, and technique used to model non-conveyance areas through input data. The documentation must include a clear explanation of the natural conditions where artificial data have been used. The Mapping Partner must ensure that non-conveyance areas that should be included in the floodplain are mapped as such.

3.4. Energy Loss Coefficients

Cells are analogous to intervening reaches between cross sections in 1-D models. For example, each cell is assigned a roughness coefficient. As in 1-D modeling, roughness is described by Manning's "n." Mapping Partners must document roughness coefficients as described in Loss Parameters under Section 2.2.5 of Hydraulics: One-dimensional Analysis. Roughness coefficient ranges available for different land cover categories are established through 1-D steady flow computations. Therefore, the roughness coefficients applied in a 2-D analysis should be validated through calibration.

3.5. Hydrologic Inputs

The choice of hydrologic procedures is associated with the size and characteristics of the watershed, the study type, the effective FIS methods, the availability of data, the requirements from the hydraulic study, and the allocated funds. In addition, information on any relevant hydrologic studies developed by other Federal or State agencies would be of use in selecting the hydrologic procedure. Hydrologic analyses, to determine the discharge characteristics along stream reaches under study, can be developed based on statewide regression equations, statistical analysis of stream gage data, or hydrologic models developed for the watershed. Unsteady flow analyses of the floodplain require the development of hydrographs using hydrologic models of the watershed. For more information about hydrologic analysis see the General Hydrologic Considerations Guidance.

For many of the 2-D models hydrologic inputs are entered as initial conditions and boundary conditions. Generally, you'll see it input two ways, as a flow hydrograph on a bounding cell or channel section originating from another basin (discussed in Section 3.5.2) or as rainfall or rainfall excess

that is input directly on the 2-D flow area. Care should be taken if rainfall is used to know whether total rainfall or rainfall excess (rainfall minus losses due to interception / infiltration) is required for the model, the models user's manual should define which is required.

If the rainfall-runoff modeling capabilities of the model are utilized for initial or boundary conditions for the hydraulic computations. Mapping Partners utilizing those capabilities should meet the analysis and documentation requirements of the rainfall-runoff input as described in the applicable parts of Hydrology Rainfall-Runoff Analysis Guidance.

3.5.1. INITIAL CONDITIONS

Initial conditions in 2-D hydraulic models are typically established by preliminary simulations (warm-up runs) until reasonable initial values are established. 2-D hydrodynamic models usually have the capability to generate initial conditions through the rainfall-runoff process. Flow is then routed through the system for a warm-up period to establish the initial water-surface elevation. In either situation, using a separate warm-up run or development of a warm-up period through rainfall-runoff and routing simulations, the Mapping Partner should fully evaluate and ensure reasonableness of the initial conditions before performing the runs that develop water-surface elevations for mapping. The Mapping Partner must document the simulation history including justification of reasonableness of the initial condition.

Rainfall-runoff modeling usually establishes antecedent conditions through input data (antecedent moisture conditions, elevations in reservoirs, etc.). The rainfall-runoff step in the 2-D modeling process often establishes starting conditions by simulating a "typical" recent history of storms. The Mapping Partner should investigate the ramifications of using other reasonable simulated histories and document that investigation. The documentation must include a discussion of the sensitivity of the results with respect to storm history and the implications regarding the frequency assigned to the results.

For areas with distinct dry and wet seasons, the Mapping Partner should use the average wet season condition, either average rainfall for the rainfall-runoff process of the hydrodynamic model or average channel flow for the hydraulic routing model, to establish the initial condition to develop water-surface elevations for mapping.

3.5.2. BOUNDARY CONDITIONS

Boundary conditions for 2-D models are similar to those for 1-D models. Rather than being associated with cross sections, boundary conditions in 2-D models are associated with boundary cells. The Mapping Partner should meet the requirements described in Starting Water-Surface Elevations, and Boundary conditions for unsteady flow in Hydraulics: One-Dimensional Analysis Guidance; for all cells where boundary conditions are user supplied.

Flow hydrographs that originate from other basins should be modeled as inflow at boundary cells. Mapping Partners must document crossing basin flow hydrographs to meet the requirements for inflow hydrographs described General Hydrologic Considerations Guidance.

3.6. Flow Paths

An advantage of using 2-D models is their capacity to identify separate flow paths in addition to the mainstream channel. Velocity, flow rate, and flow volume can identify flow paths. The Mapping Partner may create separate flood profiles for significant flow paths. Details of water-surface profiles are described in the Flood Profiles Guidance.

The profile baseline is the horizontal distance along the Flood Profile as represented on the FIRM. The profile baseline can be the distance between centers of cells along flow direction in the 2-D model. Graphic specifications for profile line types can be found in the Flood Insurance Study (FIS) Report Technical Reference.

Computer programs that offer 2-D and 1-D solution capability compute flow parameters in a form suitable to develop flood profiles and floodway data published in the FIS, because the stream channel can be modeled using cross sections based on 1-D analysis.

4. Calibration of Hydraulic Models

Calibration of hydraulic model parameters is performed through modeling major historic floods on stream reaches where flood flow and elevation data are available. By comparing the measured water surface elevation from a flood to the modeled water-surface elevation, the modeler can judge the reliability of the model and adjust input parameters accordingly. The parameters adjusted are usually energy loss coefficients. The user's manuals for most models provide guidance and, in many cases, optimization options for calibrating friction loss (roughness) coefficients. For more information on calibration of Hydraulic Models see Section 4.5 of the General Hydraulics Considerations Guidance.

5. Alluvial Fan Analysis

Alluvial fans, and flooding on alluvial fans, show great diversity because of variations in climate, fan history, rates and styles of tectonism, source area lithology, vegetation, and land use. 2-D models are a good way of defining the 1% annual-chance flood elevation on inactive areas of the alluvial fan. For more information, specific to Alluvial Fan Analysis, please see Alluvial Fans Guidance.

6. Floodway Determination

A floodway is a tool to assist communities in balancing development within the floodplain against the resulting increase in flood hazard. The Mapping Partner must coordinate with the community when developing floodways.

A regulatory floodway is defined as the channel of a river or other watercourse and the adjacent land area that is reserved from encroachment in order to discharge the base flood without cumulatively increasing the water-surface elevation by more than a designated height, or surcharge. A maximum height of 1.0 feet based on NFIP regulations should be used unless the project resides within a state or other jurisdiction that has established more stringent regulations. The portions of the floodplain

beyond the floodway are called the floodway fringe. The community is responsible for maintaining the floodway to mitigate flood hazards; the community must not allow any activities causing a rise in the BFE in the regulatory floodway. For more information about conducting a floodway analysis see the Floodway Analysis and Mapping Guidance.

7. Hydraulic Review Requirements

The reviewing Mapping Partner will be responsible for performing hydraulic reviews. The reviewing Mapping Partner is responsible for determining whether the proposed analyses are reasonable. Section 9 of the General Hydraulics Considerations Guidance provides requirements and criteria that should be used to determine if the hydraulic analyses are reasonable.

8. Deliverable Products

The Mapping Partner must submit the hydraulic and floodway data in digital format as described in Technical Reference: Data Capture. The Mapping Partner must submit files via the mapping information platform (MIP); other media may be acceptable if coordinated with FEMA.

8.1. Special Mapping Considerations

As 2-D modeling becomes used for more applications around the country additional resources are being developed. The following white papers / references are good sources for additional information:

- One-Dimensional Unsteady and Two-Dimensional Models: Issues for Regulatory Use, ASFPM 2014.
- On the issues associated with 2-D modeling for flood mapping purposes, Devinder S. Dhillon, Fabián A. Bombardelli, Wm. E. Fleenor and Kaveh Zamani 2014.
- Hunter, NM, Bates, PD, Neelz, S, Pender, G, Villanueva, I, Wright, NG, Liang, D, Falconer, RA, Lin, B, Waller, S, Crossley, AJ and Mason, D (2008) Benchmarking 2-D hydraulic models for urban flood simulations. Proceedings of the Institution of Civil Engineers: Water Management, 161 (1). 13-30.

SUPPLEMENTARY WHAFIS DOCUMENTATION

WHAFIS 4.0

Maintenance of FEMA's WHAFIS Program

April 2024

Background

FEMA's WHAFIS 4.0 program has been recompiled to ensure its continued operation within modern Windows operating systems. All changes are limited to the compiling steps taken to generate an executable file. The source code has not been edited or revised in any way. The purpose of this revision is to maintain the current functionality as described within the WHAFIS 3.0 manual (September 1988) and WHAFIS 4.0 supplement (August 2007).

What's New

The updated WHAFIS program executable has been compiled using the Intel OneAPI compiler, build 2023.1.0.46351. The build required the following prerequisite installations:

- Compatible version of Visual Studio or the Build Tools for Visual Studio
- Visual Studio Community 2022 – 17.6.4.
- .NET desktop development and Desktop development with C++ workloads

Note, these are not required software for installation of the executable, see the Installation and Setup section below for more details on the install process.

Version Testing

Testing was performed on the recompiled WHAFIS to ensure consistency with the previous WHAFIS 4.0 executable. Minor discrepancies were observed in the results reported in WHAFIS PART 1 through PART 6. These discrepancies are believed to be due to differences in significant digit storage and rounding between the previously used and new compilers. Importantly, these were found to be within an acceptable error tolerance and do not appreciably change the estimation of overland coastal hazards. Examples of these differences are summarized below:

WHAFIS Part	Differences Observed
1 Input	Slopes (column 9) reported as 0.0000 in previous build are reported as -0.0000 in new build. The change in sign was not found to affect results beyond the sign convention reported in PART 1.
4 Location of Surge Changes	Additional lines indicating a change in surge were reported in PART 4 of the new build when compared to the previous build. These additional lines describe small (approximately 0.05 feet or less, vertically) changes in the reported stillwater elevation. Conversely, lines were omitted from PART 4 of the new build when compared to the previous build. Similarly, the impact is minor, resulting in small (approximately 0.05 feet or less, vertically) changes in the reported stillwater elevation.
5 Location of V Zones	The stationing of the reported V zones were observed to have small differences (approximately 0.05 feet or less, horizontally) between the previous build and new build.

WHAFIS Part	Differences Observed
6 Numbered A Zones and V Zones	The stationing of the reported zones was observed to have minor differences (approximately 0.05 feet or less, horizontally) between the previous build and new build. The new build was also observed to insert additional lines representing redundant zones. For example, a line describing an A Zone with elevation 14 may be inserted between two other A Zones also with elevation 14.

Command Line Usage

The standalone WHAFIS 4.0 executable can be run from a command line with input and output file names provided as command line parameters, as in the following example:

WHAFIS4.exe *inputFileName outputFileName*

Installation and Setup

The current version of the software can be saved directly to any machine with a Windows operating system. The executable can be run directly from the folder it has been saved to by opening and supplying the input and output filenames. Alternatively, the executable can be called from another computing program capable of calling and interfacing with executables.

How to Update WHAFIS for CHAMP

The Coastal Hazard Analysis and Mapping Program (CHAMP) program will install the 2007 version of the WHAFIS executable. Therefore, new users installing CHAMP or users with CHAMP already installed on their computing system should replace the previous version of the executable with this recompiled version. To make the change, replace the WHAFIS4.exe file in the CHAMP program folder with the updated version as described by the steps below. The MG.DAT file does not need to be changed or replaced. The CHAMP program will utilize this WHAFIS build once the updated executable has been saved to the CHAMP program folder.

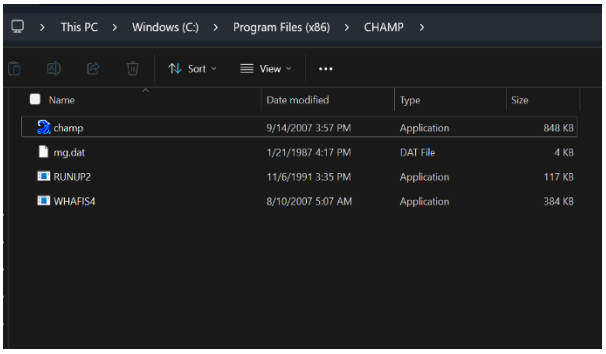
1. Download the CHAMP Application from FEMA's Coastal Engineering Tools page.
2. Run the CHAMP setup.exe file to install the program
3. Download the updated WHAFIS application:

    - WHAFIS Application

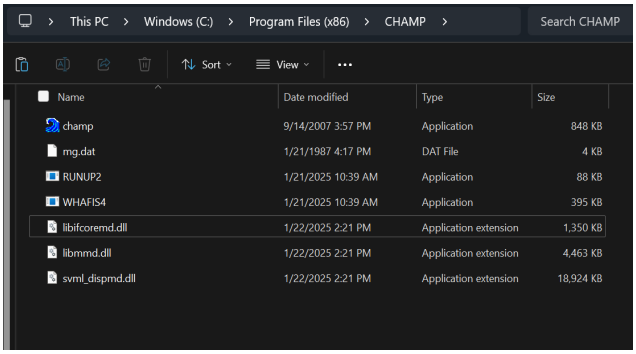
    Clicking the link above will download a zip file to your computer. The WHAFIS zip file will contain a file named "WHAFIS4.exe".

4. On your computer, navigate to the Program Files (x86) folder. Inside the Program Files (x86) folder, you will find a folder named CHAMP, which is automatically placed there when you first install CHAMP.

5. Move the newly downloaded WHAFIS4.exe files to the CHAMP folder to replace the older versions of these files. This can be done by selecting the new files and either dragging and dropping them into the CHAMP folder or by copying and pasting them.
    - Ensure the WHAFIS file is named exactly WHAFIS4.exe
    - This step requires administrative privileges, and may require Government Furnished Equipment (GFE) users to call the help desk for assistance and non-GFE users to contact similar organization IT resources.



The above figure shows the CHAMP folder **before** copying and pasting in the new RUNUP2.exe, WHAFIS4.exe, and DLL files.



The above figure shows the CHAMP folder **after** copying and pasting the new RUNUP2.exe, WHAFIS4.exe, and DLL files. The “date modified” column as seen above will contain updated dates, indicating the RUNUP2.exe and WHAFIS4.exe files have been replaced successfully.

6. After moving the files to the CHAMP folder, it will prompt you to replace the existing files. Click “Replace the file in destination” when prompted.

MEMORANDUM

To: Maria Vargas
County Judge's Office

From: Edward J. Cockrell, Sr EC
Chief Juvenile Probation Officer

Date: March 19, 2026

Re: **Commissioners' Court Agenda, March 31, 2026**

Please place the following item on the Commissioners' Court agenda for March 31, 2026.

Juvenile Probation

Receive and File the Jefferson County Juvenile Board's Inspection and Certification of the Juvenile Detention Facilities at the Minnie Rogers Juvenile Justice Center as per Title 3, Texas Family Code, Section 51.12(c).

March 17, 2026

Honorable Commissioner's Court
Jefferson County Courthouse
Beaumont, Texas 77701

Re: Jefferson County Juvenile Detention Facility

Gentlemen:

We, the undersigned, being the membership of the Jefferson County Juvenile Board, did on the 17th day of March, personally inspect the detention facilities of the Jefferson County Juvenile Detention Facility at 5326 Highway 69 South, Beaumont, Texas and do hereby certify as to the following:

1. That said facilities, in accordance with Title 3, Texas Family Code, Section 51.12 (c), are suitable for the detaining of 48 juveniles (capacity);

2. That the facilities are operated in accordance with standards for Juvenile Detention Facilities, as promulgated by the Texas Juvenile Justice Department;

3. That said Board has reviewed the Annual Reports as prepared by the facility administrator and;

4. That said facilities are now certified by this Board for 365 days.

Respectfully submitted,

Jefferson County, Juvenile Board

Juvenile Board
